MITSUBISHI MATERIALS

TURNING TOOLS / MILLING TOOLS / DRILLING TOOLS

2018-2019 | C008B

USING THIS CATALOGUE

1. This catalogue is as of April 2017.

2. Please note that products in this catalogue are continuously reviewed and updated. The products therefore may be changed in the future and thus become different from the catalogue.

3. Stock status is mentioned for the products in this catalogue. However, please note that the products here may be replaced by new grades and products in the future.

   (Note) Please contact us regarding order numbers and grades that are not mentioned in this catalogue.

4. Stock status indication

   ● : Inventory maintained.

   ▲: Inventory maintained. To be replaced by new products.

   □ : Non stock, produced to order only.

HOW TO USE THIS CATALOGUE

In this catalog, our company's cutting tools are broadly divided into two types: turning tools and rotating tools, with separate respective sections for each machining method. Please select the search method that matches your requirements when using the catalog.

1. **Search for tool types from the INDEX at the beginning of the catalog.**
   - Turning tools are classified by a green colour.
   - Milling tools are classified by a blue colour.
     (Drilling tools are classified by a red colour.)

2. **To find the series of products from the contents of the inside title**.
   Contents of each block are listed on each inside title.

3. **To find the product according to application.**
   The classification page of each block provides the series of products to be selected according to applications and purposes.

4. **Search using the index of symbol designations at the end of the catalog.**
   All tools are listed in the alphabetical index at the front of the catalogue.

OTHER WAYS TO USE THE CATALOG

The following PR materials are also available in addition to this catalog, for use as necessary.

1. **Catalogs for individual products**
   - Access the following URL and download "Tools News" for the applicable cutting tool.
     Information about tool features and examples of cutting applications are available in greater detail.

   http://www.carbide.mht.co.th/download/tools_news

2. **Online catalog (electronic catalog with search functions)**
   - Access the following URL to search for applicable cutting tools and view detailed information.
     CAD data, tooling sheets, and other resources are also available for download.

   http://www.mitsubishicarbide.net/mht/enuk/

YOUR GLOBAL CRAFTSMAN STUDIO

Mitsubishi Materials is not just a tool manufacturer.
We are committed to promptly responding to customers' challenges with the dedication of a professional craftsman and doing our best to actively contribute to their success.
We strive to become the only tool manufacturer globally offering "your personal craftsman studio", a unique service for our customers.

It is the place where you can:

Find state-of-the-art technologies and products.
Find solutions, anytime, anywhere in the world.
Share our excitement on the latest technology trends and product innovation.

It is the studio where we think, share, create and develop together with our customers exciting solutions to meet their specific needs.

YOUR GLOBAL CRAFTSMAN STUDIO
MITSUBISHI MATERIALS

[The meaning of our logo] ▶▶▶
Our logo shows people, standing on a circle, holding hands. The circle represents the earth. Holding hands reflect our commitment to grow and succeed "hand in hand" with our customers and closely work with them improving performance across the globe.
The shape of the logo embodies a variety of ideas. It captures the image of "cutting tools" combined with the dominant letter "M" of the Mitsubishi Materials brand name. It also depicts a flame that symbolizes our passion for craftsmanship.

Machining Technology Center

RESPONSIVE, ATTRACTIVE, PROACTIVE

Mitsubishi Materials Corporation, Advanced Materials & Tools Company, offers a "Comprehensive Craftsman Studio" which addresses the individual needs and requirements of our customers' in order to make their business successful. Here the Machining Technology Center is the front-line base. It is fully equipped with advanced machines, measuring instruments, extensive cutting data, knowledge, technologies as well as having a team of highly-experienced technical staff members. All of which allows Mitsubishi Materials Corporation to offer the best solution and services for our valued customers.

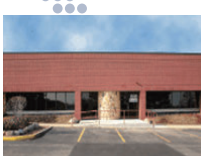
East Japan Technical Center (Saitama, JAPAN)

Central Japan Technical Center (Gifu, Japan)

MTEC Valencia (Espana)

MTEC Bangkok (Thailand)

MTEC TianJin (China)

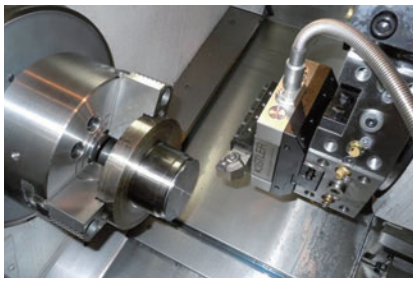


MTEC Chicago (USA)

We try answering any questions and demands from customers around the world and providing detailed solutions as well as meeting customers' expectations along with a sustainable growth of technical skills and services.

We identify the potential needs of customers and develop innovation tools to cultivate new markets for widening future business possibilities.

Showing and demonstration, Attractive events and practical seminars present the new possibilities in machining which evoke a feeling of curiosity.



1

Practical "Hands-on" training with real demonstration

TRAINING

- **Cutting Academy**
- **e-learning**
- Regional seminar
- Requested Seminar

2

Visualizing your machining

CUTTING TEST

- Test Cutting
- Selection of optimal machining conditions
- Improvements in tool life and machining quality
- Predictive tests before line input
- High-speed camera/ Cutting force/ 3D measuring device etc.

3

"RESPONSIVE", with the provision of technical services

TECHNICAL SUPPORT

- Production line diagnosis/ Process improvement
- Tooling
- Cutting Simulation
- Telephone Technical counseling

http://www.carbide.mht.co.th/solution/purpose

For details, please contact your nearest sales office. (Refer to "Domestic Sales Offices" at the end of the catalog)

We have enhanced our cutting tool data provision compliant with ISO13399.

1. What is ISO 13399?

International standard with Cutting tool data representation and exchange.
Cutting tools are required to have parameters up to the world standards like in the regulation of the database and CAD data. Another purpose of ISO 13399 is to establish smooth data communication between systems.

2. Purpose

Troublesome conversion with the manufacturers is unnecessary when you have cutting tool data that complies with ISO 13399. This can then be imported to PLM, CAM, CAM, CNC, or even as a tool management system.
Mitsubishi Materials offers cutting tool data based on ISO 13399 to support effectively improved quality and cost reduction efficiency in your improved threading and new products creation.

3. Dimension symbols conforming to ISO 13399

As shown below, the transition to dimension symbols complying with ISO13399 has begun.

4. Posting of ISO13399 Articles on the Web

We have added articles to the Mitsubishi Materials: Advanced Materials & Tools Company website. Please check these out.
URL: http://www.mitsubishicarbide.com/en/iso

Examples of change in dimensions

	Previous	New
① Inserts		② Holder		③ Milling Cutter		④ Solid Drills		
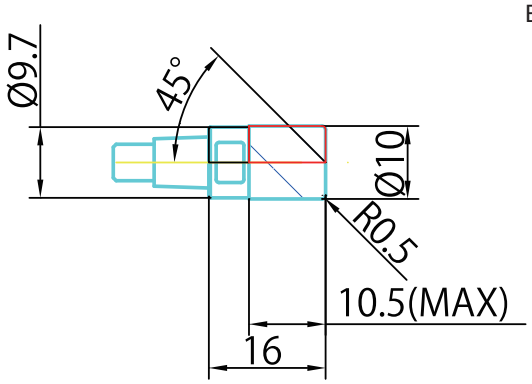
5. CAD (ISO13399 compliance)

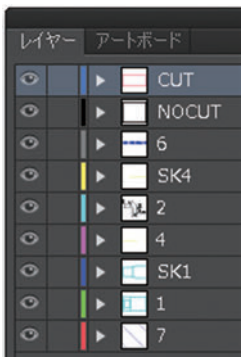
As shown below, DXF (2 dimensions) and STEP (3 dimensions) data complying with ISO 13399 are updated regularly to the Web CATALOG.

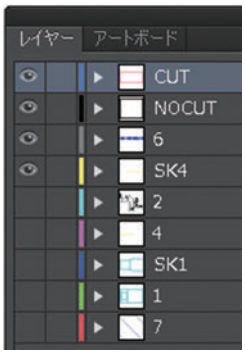
①DXF
(Full layer)

②DXF
(CUT/NO CUT layer)

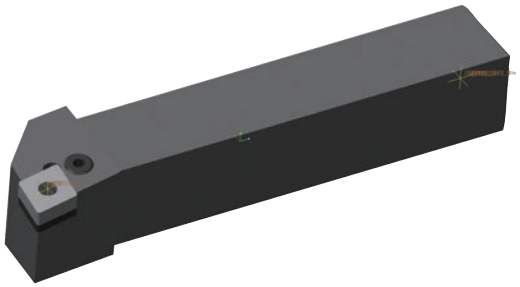
Ex. IMX10C4HV100R05010

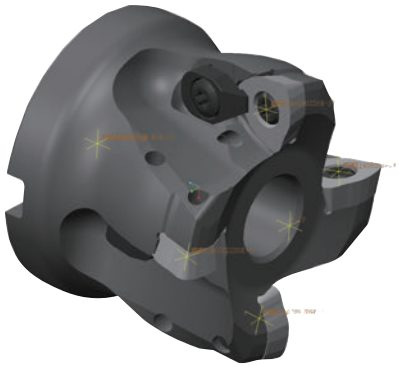




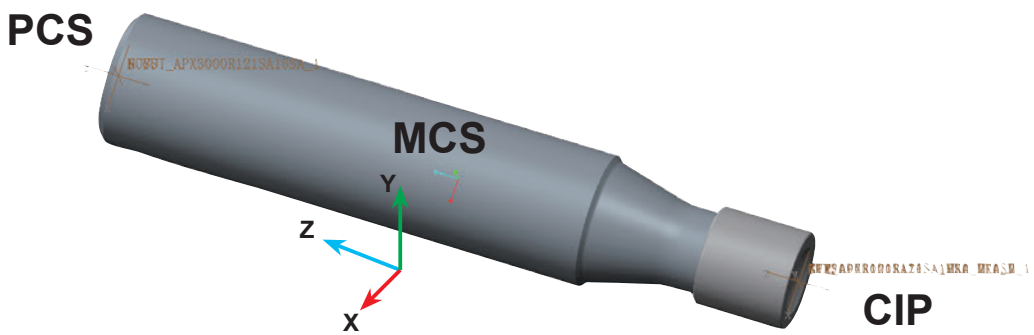


③STEP data (details, insert assembled model)





④STEP data (simple model)



*Note 1 Refer to the following URL for more information.
http://www.mitsubishicarbide.net/contents/mht/enuk/manual/manual.pdf

*Note 2 CAD is updated regularly. However, in rare cases, it may not be possible to provide the desired product. Please consult us.

Dimensions and symbols (ISO 13399 compliance)

Alphabetical

① Inserts

Symbol	Content
AN	Clearance angle major
AS	Clearance angle wiper edge
BCH	Corner chamfer length
BS	Wiper edge length
CDI	Insert cutting diameter
CDX	Cutting depth maximum
CECC	Cutting edge condition code
CEDC	Cutting edge count
CF	Spot chamfer
CNC	Corner count
CW	Cutting width
D1	Fixing hole diameter
EPSR	Insert included angle
GAN	Insert rake angle
HAND	Hand
IC	Inscribed circle diameter
INSL	Insert length
KRINS	Cutting edge angle major
L	Cutting edge length
LBB	Chip breaker width
LE	Cutting edge effective length
LF	Functional length
M	m-dimension
NT	Tooth count
PAL	Rrofile angle left hand
PAR	Rrofile angle right hand
PDPT	Profile depth insert
PDX	Profile distance ex
PDY	Profile distance ey
PNA	Profile included angle
PSIRL	Cutting edge angle major left hand
PSIRR	Cutting edge angle major right hand
RAL	Relief angle left hand
RAR	Relief angle right hand
RE	Corner radius
REL	Corner radius left hand
RER	Corner radius right hand
S	Insert thickness
SC	Insert shape code
SIG	Point angle
TC	Tolerance class insert
THFT	Thread form type
THL	Threading length
TP	Thread pitch
TPI	Threads per inch
TPT	Thread profile type
TTP	Thread type
W1	Insert width

② Turning

Symbol	Content
B	Shank width
CDX	Cutting depth maximum
CSP	Coolant supply property
CUTDIA	Work piece parting diameter maximum
CW	Cutting width
DAXN	Axial groove outside diameter minimum
DAXX	Axial groove outside diameter maximum
DCON	Connection diameter
DMIN	Minimum bore diameter
DMM	Shank diameter
ECA	End chamfer angle
ECD	End chamfer distance
GAMF	Rake angle radial
GAMN	Rake angle normal
GAMO	Rake angle orthogonal
GAMP	Rake angle axial
H	Shank height
HAND	Hand
HBH	Head bottom offset height
HBKW	Head back offset width
HBL	Head bottom offset length
HF	Functional height
HTB	Body height
KAPR	Tool cutting edge angle
LAMS	Inclination angle
LB	Body length
LDRED	Reduced body diameter length
LF	Functional length
LH	Head length
LPR	Protruding length
LS	Shank length
LTA	LTA length (length from MCS to CRP)
LU	Usable length
OAH	Overall height
OAL	Overall length
OAW	Overall width
PSIR	Tool lead angle
TQ	Torque
WF	Functional width

*Note 1 This symbol complies with TS standard or DTS standard of ISO 13399.
*Note 2 The above does not include the unset symbols or original Mitsubishi Materials symbols of ISO 13399.
*Note 3 Changes and additions may be made because the table above also includes symbols under deliberation.

③ Milling

Symbol	Content
APMX	Depth of cut maximum
AZ	Plunge depth maximum
BD	Body diameter
BDX	Body diameter maximum
BHTA	Body half taper angle
BMC	Body material code
CBDP	Connection bore depth
CCMS	Connection code machine side
CCWS	Connection code workpiece side
CICT	Cutting item count
CRKS	Connection retention knob thread size
CSP	Coolant supply property
CW	Cutting width
DAH	Diameter access hole
DBC	Diameter bolt circle
DC	Cutting diameter
DCB	Connection bore diameter
DCCB	Counterbore diameter connection bore
DCIN	Cutting diameter internal
DCINN	Cutting diameter internal minimum
DCINX	Cutting diameter internal maximum
DCN	Cutting diameter minimum
DCON	Connection diameter
DCONMS	Connection diameter machine side
DCONWS	Connection diameter workpiece side
DCX	Cutting diameter maximum
DCSFMS	Contact surface diameter machine side
DMM	Shank diameter
DN	Neck diameter
HAND	Hand
GAMF	Rake angle radial
GAMP	Rake angle axial
KAPR	Tool cutting edge angle
KWW	Keyway width
LAMS	Inclination angle
LCCB	Counterbore depth connection bore
LE	Cutting edge effective length
LF	Functional length
LH	Head length
LPR	Protruding length
LTA	LTA length (length from MCS to CRP)
LU	Usable length
LUX	Usable length maximum
MTP	Clamping type code
OAL	Overall length
PSIR	Tool lead angle
RE	Corner radius
RMPX	Ramping angle maximum
RPMX	Rotational speed maximum
TQ	Torque
WT	Weight of item
ZEFF	Face effective cutting edge count
ZEFP	Peripheral effective cutting edge count

④ Drilling

Symbol	Content
BD	Body diameter
CDI	Insert cutting diameter
CND	Coolant entry diameter
CNT	Coolant entry thread size
CRKS	Connection retention knob thread size
CSP	Coolant supply property
CXD	Coolant exit diameter
CZC	Connection size code
DC	Cutting diameter
DCON	Connection diameter
DCSFMS	Contact surface diameter machine side
DMM	Shank diameter
FHA	Flute helix angle
HAND	Hand
LBX	Body length maximum
LCF	Length chip flute
LF	Functional length
LH	Head length
LPR	Protruding length
LU	Usable length
NOF	Flute count
OAL	Overall length
PL	Point length
RPMX	Rotational speed maximum
SDL	Step diameter length
SIG	Point angle
ULDR	Usable length diameter ratio
ZEFF	Face effective cutting edge count
ZEFP	Peripheral effective cutting edge count

⑤ Others

Symbol	Content
ASP	Adjusting screw protrusion
BD	Body diameter
CBDP	Connection bore depth
CRKS	Connection retention knob thread size
CZC	Connection size code
DBC	Diameter bolt circle
DC	Cutting diameter
DCB	Connection bore diameter
DCON	Connection diameter
DCONMS	Connection diameter machine side
DCONWS	Connection diameter workpiece side
DF	Flange diameter
DMM	Shank diameter
FLGT	Flange thickness
HF	Functional height
KWL	Keyway length
KWW	Keyway width
LB	Body length
LF	Functional length
LPR	Protruding length
LS	Shank length
LSCX	Clamping length maximum
LU	Usable length
MHA	Mounting hole angle
MHD	Mounting hole distance
MHH	Mounting hole height
OAL	Overall length
WF	Functional width

NEW PRODUCTS

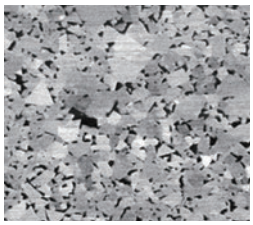
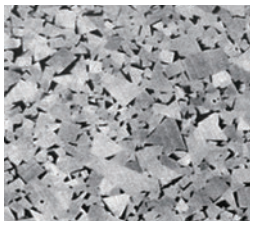
Carbide Grade (Non Coated)



MT9005

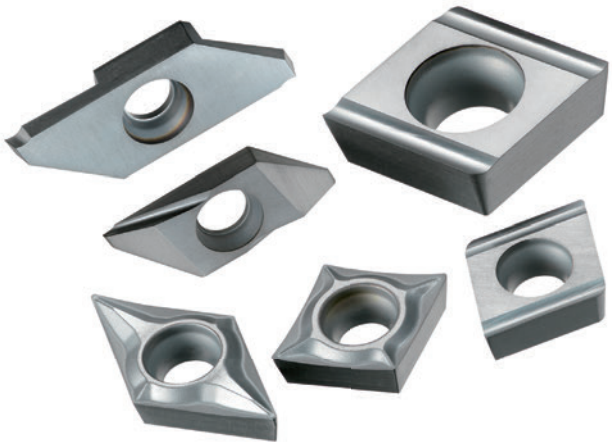


MT9015

NEW PRODUCTS

PVD Coated Cemented Carbide Grade for Carbon Steel

MS6015

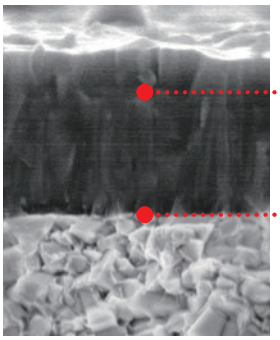


Skilled at pure iron, carbon steel and free cutting steel turning and achieving implemented stable finished surfaces and excellent dimensional accuracy.

A fine compatible collaboration of a special carbide substrate and a new PVD coating that greatly improves wear resistance.

	MS6015	Conventional
Coating	TiCN multilayer	TiAlN
Hardness (HV)	3,000	2,800
Wear Coefficient (Carbon Steel)	Low	High
Base Material Hardness (HRA)	92.0	92.0
T.R.S (GPa)	2.0	2.0

Ti-C-N Multilayer Coating



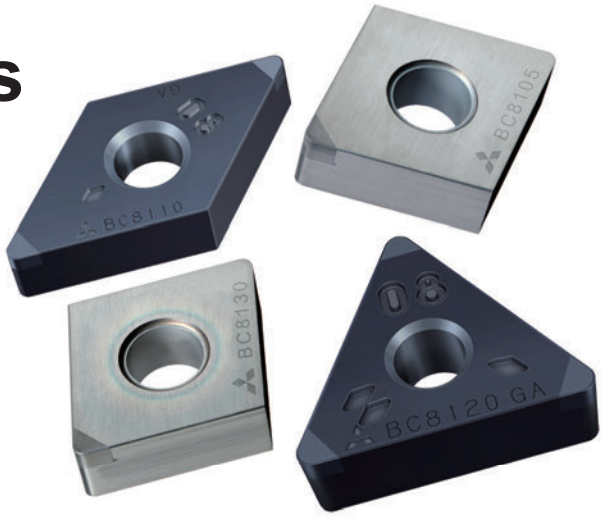
Superior wear and welding resistance and demonstrating the best possible results for carbon steel.

Minute multilayers remarkably improve welding.

>>>200

Coated CBN-Series for Hardened Steel Turning

BC8100 Series



New Generation Coated CBN Grades

Wear and fracture resistance greatly improved for a wide range of continuous and interrupted applications.

BC8105

Highest Accuracy

BC8110

High Speed Turning

For Continous Cutting

BC8120

General Applications

For Continuous to Medium Interrupted Cutting

BC8130

Tough Machining

For Unstable Applications and Heavy Interrupted Cutting

NEW PRODUCTS

>>>1364

Low Cutting Resistance, Double Sided Insert Face Mill for General Machining

WSX445 Series

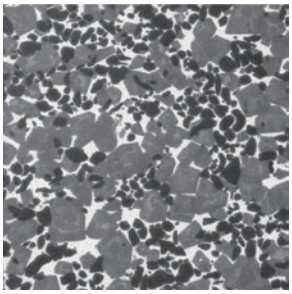
Unique geometry minimizes chatter and vibration!

NEW

Cermet Grade

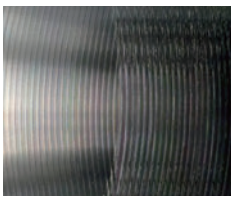
MX3030

Excellent welding and fracture resistance provides a coated finish.

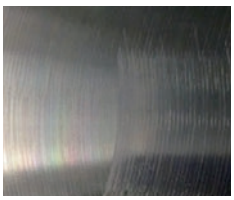


— Cutting Edge

Double sided Z Geometry



Conventional



MX3030

<Cutting Conditions>
Work Material: ASTM A36M
Cutter Dia. : ø125mm
Cutting Speed : 200m/min
Feed per Tooth : 0.1mm/t.
Depth of Cut : ap=2.0mm
ae=100mm
Cutting Mode : Dry Cutting
Center Cut
After 8m Cutting Work
8 Inserts

AHX475S

For High Feed Machining

NEW PRODUCTS

>>>1412

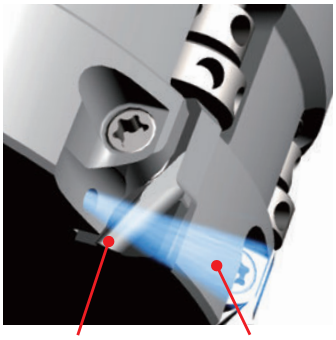
High Feed Finish Milling Cutter

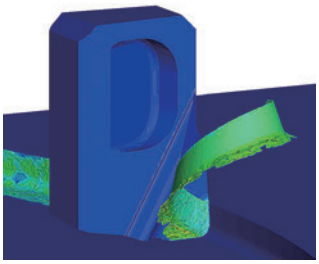
FMAX

Feed Maximum (FMAX) milling cutter for ultra efficient and accurate finishing.

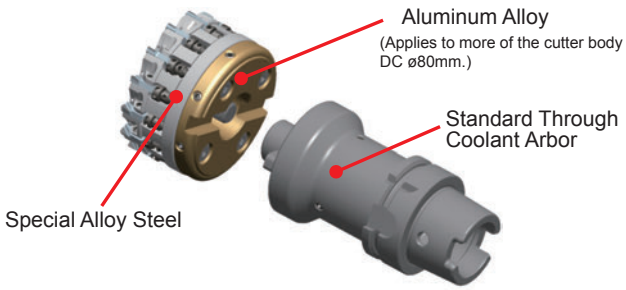
Internal coolant and a special chip breaker wall (Body protector) provides ideal chip discharge performance.

A special alloy steel and aluminum body combine to provide rigidity and light weight.





*Graphical Representation.

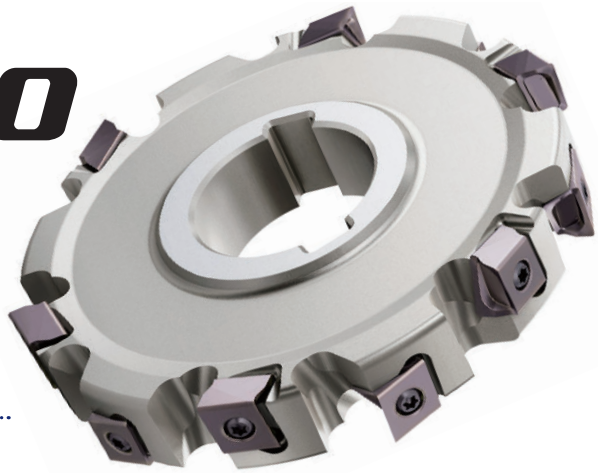


>>>1436

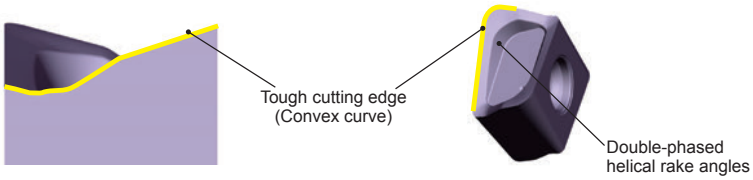
Exchangeable Inserts Side Cutter

VAS400/500

Non-chattering Side Cutter
Vertical blade double-sided insert VAS400

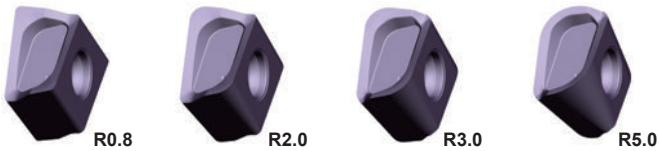


Low cutting resistance insert → Preferred sharpness



Various corner R development

R0.4, R0.8, R1.2, R1.6, R2.0, R2.4, R3.0, R4.0, R5.0, R6.0, R7.0 are inventory maintained.



Insert for VAS400

NEW PRODUCTS

>>>924

For Machining of Hardened Steels

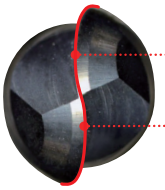
IMPACT MIRACLE REVOLUTION

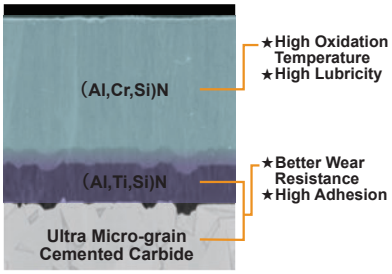
VFR2SB / VFR2SBF

Revolutionary Hardened Steel
New coating provides amazingly long life

VFR2SB

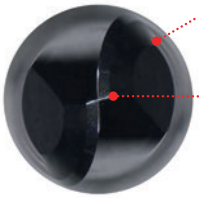
2 Flute Ball Nose End Mill





VFR2SBF

2 Flute Ball Nose End Mill for Mirror Finish Cutting



Selection According to Work Material Hardness

>>>993

Carbide End Mills

MSplus Series

Tough applications require "Plus" performance.

NEW MPXLRB

Suitable for high precision and high efficient machining of die & mold.

Seamless Cutting Edge

Radius tolerance R±0.005mm

MPJHV

Suitable for high precision and high efficient machining of die & mold.

MPMHVRB

A high-efficiency 4-flute radius end mill with irregular helix flutes and a wide range of application.

MPMHV

Improved Geometry

NEW PRODUCTS

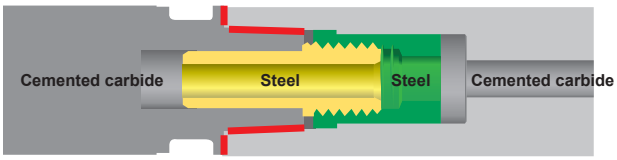
>>>690

Exchangeable Head End Mills

iMX Endmill Series

Carbide + Carbide Double face contact with head type expands the application possibilities.

Rigidity near that of a solid tool secured by ultra-hardening of all head and holder clamping surfaces.
Varied head replacement is associated with high efficiency.



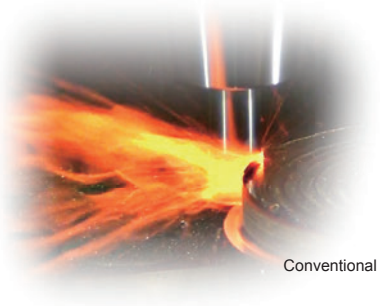
>>>1216

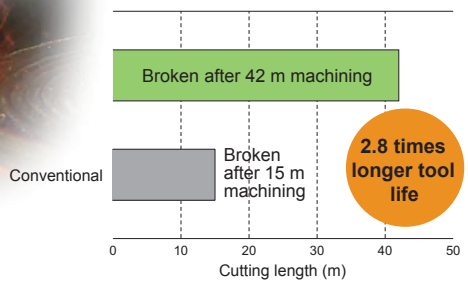
Ceramic End Mills

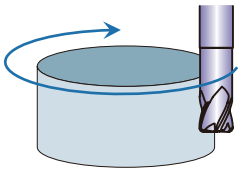
CERAMIC Corner Radius End Mills

Ultra high productivity for nickel based heat resistant alloys

Tool life comparison-Inconel®718 (HRC 45)







<Cutting condition>
Tool : ø12xR1.5
Revolution : 18,568 min^{-1} (700 m/min)
Feed rate : 6,684 mm/min (0.06 mm/tooth)
Depth of cut : ae = 2.4 mm
ap = 9.0 mm
(Down cut)
Overhang : 24 mm
Cutting mode : Dry (No air blow)

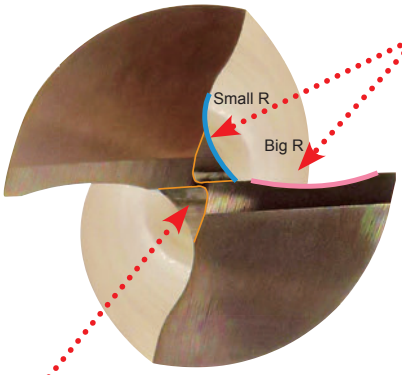
NEW PRODUCTS

>>>1768

Solid Carbide Flat Bottom Drills

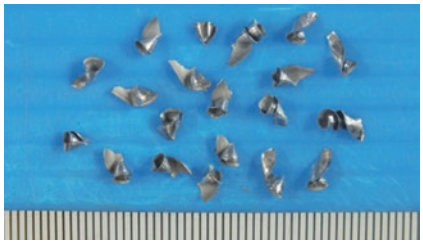
MFE Series

Shorter processes for many types of machining
High Efficiency Drilling in Various Types of Machining



Excellent Chip Control

Combination of different radius sizes provides strong cutting edge and excellent chip control.



New "Z" Thinning with Lower Thrust Force

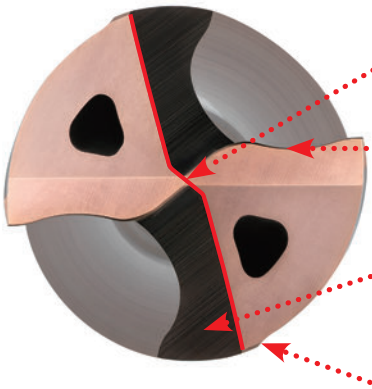
New thinning provides excellent chip evacuation.

>>>1647

Solid Carbide Drills

MVE/MVS Series

New Generation Solid Carbide Drills
With New TRI-cooling Technology



New Type Thinning

New Wavy Cutting Edge

New Flute Shape

Double Margin

NEW **Long Type**
DCx10, 15, 20, 25, 30, 35, 40

NEW **Pilot Type**
DCx2

SAFETY OF CUTTING TOOL PRODUCTS

1. Use of Cutting Tool Products

Packages of Mitsubishi products carry a safety warning label. However, tools are not labeled with detailed warning indications. Please read the "Safety of Cutting Tool Products" in this catalogue before handling cutting tool products and cemented carbide materials. Moreover, as a part of your workers' safety education, please notify the contents of the "Safety of Cutting Tool Products" to all workers.

2. Basic Characteristics of Hard Tool Materials

In Terms of "Safety of Cutting Tool Products"

Hard Tool Materials : General term for tool materials like cemented carbide alloy, cermet, ceramics, sintered CBN, sintered diamond, high speed steel and alloy steel, etc.

Physical Characteristics

Appearance : Varies depending on the type of material. Eg. grey, black, gold, etc.
Smell : None
Hardness, Specific Gravity :

Hard Tool Materials	Hardness (HV)	Specific Gravity	Hard Tool Materials	Hardness (HV)	Specific Gravity
High Speed Steel (HSS)	200—1200kg/mm²	7—9	Sintered CBN	2000—5000kg/mm²	3—5
Cemented Carbide	500—3000kg/mm²	9—16	Sintered Diamond	8000—12000kg/mm²	3—5
Cermet	500—3000kg/mm²	5—9	Alloy Steel	200—1200kg/mm²	7—9
Ceramics	1000—4000kg/mm²	2—7	Diamond Electroforming Product	8000—12000kg/mm²	3—5

Constituents

Carbide, nitride, carbon nitride, oxide, such as W, Ti, Al, Si, Ta, B, V and metals such as Fe, Co, Ni, Cr, Mo.

3. Safety of Cutting Tool Products

○Hard tool materials have a large specific gravity. Thus, they require special attention as heavy materials when the size or quantity is large.

○Cutting tool products generate dust and mist during grinding operations or heating. This dust and mist can be harmful when coming in contact with the eyes or skin, or if substantial quantities are swallowed. When grinding and machining, it is recommended to use local exhaust ventilation and respirators, a dust protective mask, glasses, gloves etc. If dust makes contact with the hands, thoroughly wash the affected area with soap and water. Don't eat in the exposed area, and wash hands thoroughly before eating. Remove dust from the clothing by a cleaning or washing, but don't shake off.

○Cobalt and nickel contained in carbide or other cutting tool materials are reported as possibly carcinogenic to humans. It is also reported that cobalt and nickel dust and mist can affect the skin, respiratory organs and heart through repeated or prolonged contact.

○For further information, please refer to **SDS** (Safety Data Sheet).
SDS=Safety Data Sheet
Home page: http://www.carbide.mht.co.th/download/safety

4. Handling Cutting Tool Products

○Surface conditions affect toughness of cutting tools. Therefore, use a diamond grinding wheel for finishing.

○Hard tool materials are extremely hard and brittle at the same time. Thus, they may be broken by shocks and tightening with excess force.

○Hard tool materials and ferrous materials have different thermal expansion ratios. Shrinkage or swell fit products may suffer from cracks when applied temperature is higher or lower than the appropriate temperature for the tool.

○Pay special attention on storing hard tool materials. Toughness of hard tool materials is lowered when they corrode due to coolant and other liquid.

○When brazing hard tool materials, if the temperature is too high or too low from the melting point of the brazing material, loosening and breakage may occur.

○After regrinding cutting tools, make sure that there are no cracks.

○Machining hard tool materials on EDM may cause cracks on the surface due to electrons remaining after the EDM operation, resulting in lowering of the toughness. Eliminate these cracks by grinding, etc.

SUGGESTIONS ON HOW TO USE CUTTING TOOLS

Products	Hazard	Countermeasure
All Cutting Tools	◎Cutting tools have sharp cutting edges. Handling them with bare hands may cause injuries.	★Take precautions such as wearing gloves especially when handling tools and during installation.
	◎Improper use of tools and application of inappropriate cutting conditions may cause the tool to break and be expelled from the machine providing risk of injury.	★Ensure safety guards and goggles are used. ★Refer to handling explanatory notes and catalogues. Use tools under recommended cutting conditions.
	◎Impact load and rapid increase of cutting resistance due to excessive wear may cause the tool to break and be expelled from the machine providing risk of injury.	★Ensure safety guards and goggles are used. ★Exchange tools before excessive wear occurs.
	◎Cutting tools and workpieces become extremely hot during cutting. Touching them with bare hands may cause burns.	★Take precautions such as wearing gloves.
	◎Expelled hot chips produced in cutting produces risk of injuries and burns.	★Ensure safety guards and goggles are used. ★During swarf removal and machine cleaning ensure the machine is stopped and wear gloves. Please use tools, such as cutting nippers and cutting clippers.
	◎In cutting, sparks, hot chips and heat generation caused by tool breakage provides a risk of igniting a fire.	★Avoid using cutting tools in places where there is a possibility of igniting a fire. ★In case of using non-water soluble oil, make sure to have a fire prevention countermeasure.
	◎Using machines, chucks, and tools with poor balance at high revolutions may cause tools to break providing risk of injuries.	★Ensure safety guards and goggles are used. ★Check the machine for vibration, chattering, and abnormal noise.
	◎Handling machined parts with burrs using bare hands may cause injuries.	★Wear gloves.
Indexable Inserts Type Tools	◎If inserts and spare parts are not held securely, they may become loose and be expelled producing risk of injuries.	★Clean insert locating seat and spare parts before setting inserts. ★Use the tool provided for setting inserts, and ensure the inserts and spare parts are clamped securely. Do not use the tool provided for things other than prescribed inserts and spare parts.
	◎Clamping inserts and spare parts too tightly by using tools such as extension pipes may cause them to break and be expelled.	★Do not use extra tools for more leverage. Only use the tool provided.
	◎When applying high cutting speed, spare parts and inserts may be expelled due to centrifugal force. Pay special attention on each safety guidline.	★Refer to the handling explanatory notes and catalogues. Use tools under recommended cutting conditions.
Cutters and Other Rotating Tools	◎Milling cutters have sharp edges. Handling them with bare hands may cause injuries.	★Take precautions such as wearing gloves.
	◎Poor balance or off center revolving of tools may cause vibration and chattering which could cause the tool to break and be expelled.	★Apply cutting speed within the range of recommended cutting conditions. ★Adjust accuracy and balance of spindles and bearings periodically to prevent off center revolving and chattering caused by wear on these parts.
Drilling Tools	◎Through cutting in cases when the workpiece revolves may produce a disk shaped peice with sharp edges when the cutting tool breaks through.	★Ensure safety guards and goggles are used. Also install a cover on the chuck.
	◎Drills with an extremely small diameter have a very sharp point which may puncture the skin if not handled carefully. If the drill breaks during cutting, the broken pieces may be expelled.	★Handle with care. Take precautions such as wearing gloves and goggles.
Brazed Tools	◎Weakening of the braze and breakage of inserts may cause injury.	★Before using them, ensure they are brazed securely. ★Do not use them under conditions which produce very high temperature.
Others	◎Machine and tools may be damaged if they are used for purposes other than the prescribed application.	★Use them strictly for the prescribed application.

INFORMATION

This catalogue completes the basic precautions for safety use of our company's products.
For further information, please refer to the guideline, catalogs or contact us. We are not responsible for any accidents causing by modifying tools without our permission.

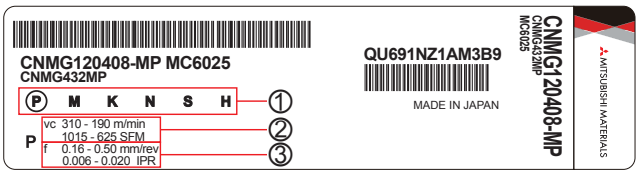
TOOL NAVI

TOOL NAVI

OUTLINE

TOOL NAVI supports our customers with information and suitable cutting conditions for each work material by selecting an optimal indexable insert together with the optional tool.

LABEL INDICATION



*1 The above is an example. There may be inserts recommended for multiple work materials.
*2 Please contact us for recommended cutting conditions using coefficient values other than the above.

①Work materials

P : Steel (Material reference : Carbon steel, alloy steel 180HB)
M : Stainless steel (Material reference : Austenitic stainless steel 180HB)
K : Cast iron (Material reference : Gray cast iron, ductile cast iron 180HB)
N : Aluminium alloy, non-ferrous metal
S : Material reference : Titanium alloy 320HB, Ni, Co-Based Alloy 400HB
H : Hardened steel 60HRC

②CUTTING SPEED STANDARDS

Work Material	Tool Life		Work Material	Hardness
	Life	Performance		
P	90min	15min	Carbon steel, alloy steel	180HB
M	90min	15min	Stainless steel	180HB
K	90min	15min	Cast iron	180HB
S	25min	5min	Titanium alloy	320HB
			Ni, Co-Based alloy	400HB
H	80min	10min	Hardened steel	HRC60

*3. N :Life based on each grade. For stable choose the performance cutting speed and for unstable choose the tool life feed rate.
*4. The tool life is based on the following (VB wear). Some materials include elements other than this.
PMKS ··· VB=0.3mm
H ··· VB=0.1mm

③Feed rate

Minimum and maximum feed rate settings are based on the chip control range of the chip breaker.

TOOL LIFE

Cutting speed has a large affect on tool life. TOOL NAVI is based on Taylor's equation (relationship vc T^n=C between tool grade, cutting conditions, and tool life). Therefore, performance speed and tool life is found for each work material. When the customer requires a different tool life, obtain coefficient values of the grade you use from the charts below. Multiply the coefficient values by the cutting speed to calculate a new cutting speed.

P Grade (Steel) cutting speed coefficient values.

Grade \ Tool life	15min	30min	45min	60min	90min
UE6105	1.00	0.79	0.69	0.63	0.55
MC6015	1.00	0.82	0.72	0.67	0.59
MC6025	1.00	0.83	0.75	0.69	0.62
MC6035	1.00	0.88	0.82	0.78	0.73
MP3025	1.00	0.85	0.77	0.72	0.65
NX2525	1.00	0.87	0.80	0.76	0.70

M Grade (Stainless Steel) cutting speed coefficient values.

Grade \ Tool life	15min	30min	45min	60min	90min
MC7015	1.00	0.83	0.75	0.70	0.63
MC7025	1.00	0.90	0.84	0.80	0.75
MP7035	1.00	0.84	0.76	0.71	0.62
US735	1.00	0.78	0.68	0.61	0.53

K Grade (Cast Iron) cutting speed coefficient values.

Grade \ Tool life	15min	30min	45min	60min	90min
MC5005	1.00	0.83	0.75	0.70	0.63
MC5015	1.00	0.83	0.75	0.69	0.62

(ex.) Medium cutting of steel
The 1st recommendation : MC6025
Indexable inserts : CNMG120408-MP
Recommended cutting speed : vc=310m/min
(Tool life : 15min.)

↓

Tool life required by the customer : 30min.

310×0.83≒257m/min

HARDNESS OF THE WORK MATERIAL

Hardness of the work material also affects tool life. Mitsubishi's TOOL NAVI suggests cutting speed variations when hardness differs. Obtain the suitable coefficient value for each type of work material from the chart below. Multiply the coefficient value by the recommended cutting speed of the grade you use to calculate a new cutting speed.

Work material	Soft ← (Hardness of workpiece) → Hard											
	120HB	140HB	160HB	180HB	200HB	220HB	240HB	260HB	280HB	300HB	320HB	340HB
P	1.34	1.19	1.08	1.00	0.92	0.85	0.80	0.75	0.71	0.68	0.64	0.61
M	1.41	1.23	1.10	1.00	0.91	0.85	0.78	0.72	0.68	0.64	0.61	0.58
K	1.27	1.19	1.09	1.00	0.97	0.91	0.88	0.85	0.81	0.78	0.75	0.72

OPTIMUM GRADES AND CHIP BREAKERS FOR EXTERNAL TURNING

Selection of optimum inserts for turning

The following diagrams show for each type of work material, the optimal combination of suitable grades and chip breakers for each application area in turning.

CUTTING CONDITIONS

- **Stable Cutting** — Continuous Cutting, Constant Depth of Cut, Pre-Machined, Securely Clamped Component Cutting
- **General Cutting**
- **Unstable Cutting** — Heavy Interrupted Cutting, Irregular Depth of Cut, Low Clamping Rigidity Cutting

CUTTING AREA

- **F** Finish Cutting
- **L** Light Cutting
- **M** Medium Cutting
- **R** Rough Cutting
- **H** Heavy Cutting

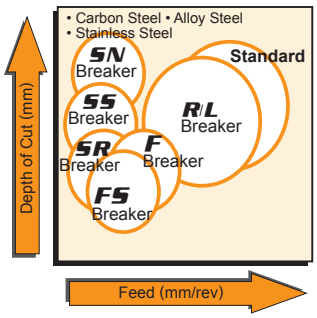
PRECISION BREAKER SYSTEM

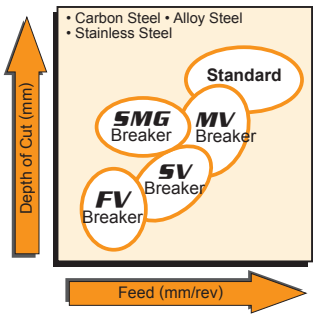
ANGULAR AND PARALLEL CHIP BREAKER

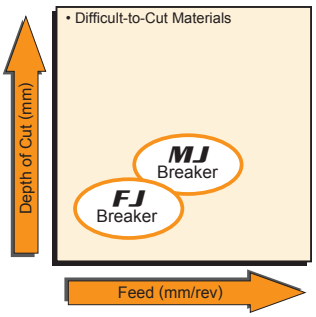
CHIP CONTROL RANGE



3-D CHIP BREAKER

CHIP CONTROL RANGE





FEATURES OF CHIP BREAKER

Breaker	Features	CCGH/CCGT Type	CCMH/CCMT CPMH/CPMT Type	DCMT Type	DCGT Type	TCGT/TCMT Type	TPMH Type	VBGT/VBMT Type	VCMT Type	WBMT/WCGT Type
SMG (G class)	● For medium cutting. ● 3D moulded chipbreaker provides good chip control. ● G class insert gives sharp cutting action, allowing high precision machining.		—	—		—	—	—	—	—
FV (M class)	● Sharp cutting edge and low resistance design achieves excellent cutting performance. ● Suitable for low depths of cut and low feed rates.	—			—					—
SV (M class)	● For light cutting. ● A peninsular dot ensures chip control at depths of cut under 1mm.	—			—	—				—
MV (M class)	● A positive insert and the large rake angle achieve sharp cutting edge performance. ● The double breakers and round-shaped dots in the rake face achieve a wide range of chip discharge.	—			—	—				
Standard (M class)	● For medium cutting. ● Balance of edge strength and sharpness due to a combination of a flat land and large rake angle.	—			—		—			—
FJ	● The curved edge allows smooth chip discharge. ● The large rake angle highly suitable for finishing difficult-to-cut materials.		—	—			—	—	—	
MJ	● The curved edge allows smooth chip discharge. ● Large rake angle highly suitable for finish-light cutting difficult-to-cut materials.		—	—			—	—	—	

Breaker	Features	CCGH/CCGT Type	CPGT Type	DCGT Type	TPGH Type	TPGV/TPGT Type	TCGT Type	VBGT/VCGT Type	WBGT Type	WCGT Type	WPGT Type
FS	● For precision finishing. ● Small width lead breaker for excellent chip control. ● Sharp cutting edge gives a good surface finish.	—	—	—		—	—	—	—	—	
F	● For finish cutting. ● Lead breaker controls chip flow. ● Sharp cutting edge gives a good surface finish.				—					—	—
R/L	● Lead breaker for light cutting. ● Good chip control for low to medium feed rates.	—	—	—	—	—	—	—	—		—
Standard	● For light cutting. ● Good chip control for low to medium feed rates.	—		—	—	—	—	—	—	—	

Breaker	Features	CCET Type	CCGT Type	DCET Type	DCGT Type	VBET Type
SR	● The wide lead breaker for medium cutting is suitable for automatic lathe machining. ● The insert design for low resistance controls chip flow.		—		—	SS	● The parallel breaker for light cutting is suitable for automatic lathe machining. ● Excellent chip control at low feed rates.	—		—		—
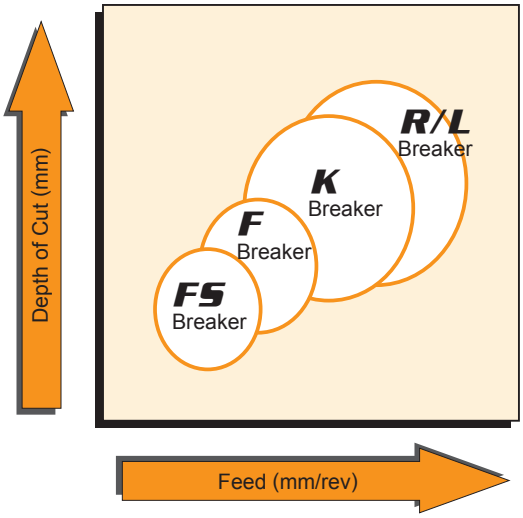
SN	● The parallel breaker for general purpose is suitable for automatic lathe machining. ● Excellent chip control for low to medium feed rates.					
ANGULAR AND PARALLEL CHIP BREAKERS (NEGATIVE INSERTS)

CHIP CONTROL RANGE



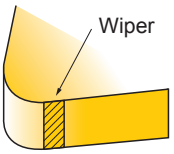
FEATURES OF CHIP BREAKER

Breaker	Features	DNGG Type	SNGG Type	TNGG Type	VNGG Type
FS	● For precision finishing. ● Small width lead breaker for good chip control. ● Sharp cutting edge gives a good surface finish.	—	—		—
F	● For finish cutting. ● Lead breaker controls chip flow. ● Sharp cutting edge gives a good surface finish.	—	—		—
K	● Parallel breaker for light cutting. ● Excellent chip control for low to medium feed rates.	—	—		—
R/L	● Parallel breaker for medium cutting. ● Good chip control for medium feed rates.				

WIPER INSERT

What is a Wiper Insert?

- The wiper insert is designed with a wiper edge that is situated where the straight edge meets the corner radius.
- In comparison to conventional breakers, the surface finish does not deteriorate even if the feed rate is doubled.
- Machining at high feed rates improves cutting efficiency.



●Improving Surface Finish

Under the same machining conditions as conventional breakers, but with the feed rate increased, the surface finish of the workpiece can be improved.

●Improving Efficiency

High feed rates not only shortened machining times but also make it possible to combine roughing and finishing operations.

●Increased Tool Life

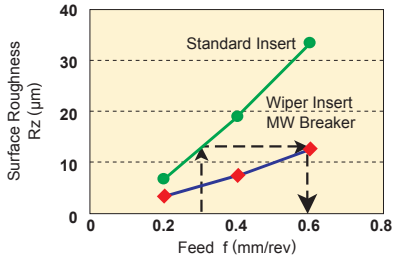
When a change to high feed conditions, the time required to cut one component is decreased, thus more parts can be machined with each insert. In addition, the high feed rate prevents rubbing, therefore, delaying the progression of wear and increasing the tool life of the insert.

●Improving Chip Control

Under high feed conditions, the chips generated become thicker and are more easily broken, thus, chip control is improved.

Wiper insert + High feed (The feed rate is doubled.) — Finished surface Same surface roughness — **Standard insert + The conventional feed condition**

*Please use a wiper insert at high feed rate.



<Cutting Conditions>
Workpiece : JIS S45C
Insert : CNMG120408-○○
Cutting Speed=200m/min
Depth of Cut=1.5mm
Feed Speed=0.2−0.6mm/rev
Wet Outer Diameter Cutting

<Ex>The surface roughness does not deteriorate even if the feed rate is doubled (0.3→0.6)!

■A wiper insert + machining at high feed rate

- Reduced machining time (per workpieces)
- Increased number of workpieces (per definitive time period)
- Improving chip control

■A wiper insert + machining at conventional feed rate

- Eliminating the finishing step by roughing and finishing together (Separate roughing and finishing steps → Single-step machining)

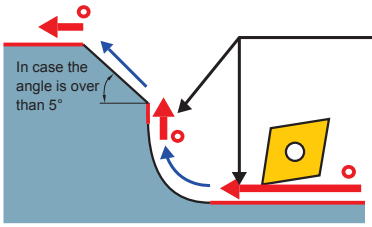
- Reducing cycle times
- Increased productivity
- Avoiding Line-Stoppage

<The realization of Reduced Costs!!>

The estimate of finished surface roughness when using a wiper insert

The effects of wiper inserts on external machining, boring and facing.

*The surface roughness when machining at corner R or taper angle over 5°, is the same as machining with standard inserts.



Rz(W)=Rz×0.5

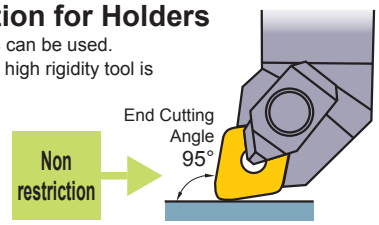
Rz(W) = Finished surface roughness when using a wiper insert.
Rz : Finished surface roughness from conventional conditions. (When using a standard insert)

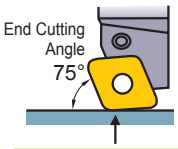
Effective uses of a wiper insert
Non effective uses of a wiper insert

Special attention is not necessary when using CNMG • WNMG • CCMT types

■No Restriction for Holders

A standard holders can be used.
(*A double clamp, high rigidity tool is recommended.)

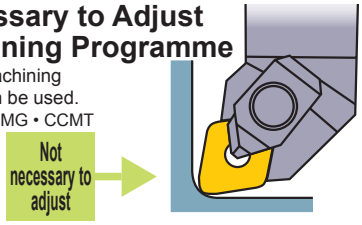




The CNMG type can be used as a wiper at the 100°corner.

■Not Necessary to Adjust the Machining Programme

Conventional machining programmes can be used.
(The CNMG • WNMG • CCMT types are based on the ISO/ANSI.)

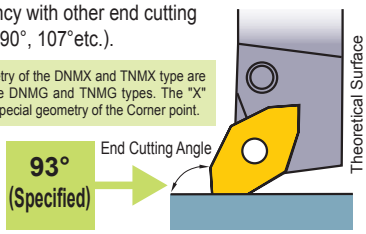


Special attention is necessary when using the DNMX • TNMX types due to the special top face geometry

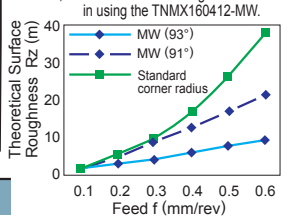
■Restriction for Holders

Use a holder with end cutting angle 93° for improving wiper efficiency. A holder with end cutting angle 91° can improve wiper efficiency (see the following figure), however, there is no wiper efficiency with other end cutting angles (60°, 90°, 107°etc.).

The hole geometry of the DNMX and TNMX type are the same as the DNMG and TNMG types. The "X" represents the special geometry of the Corner point.

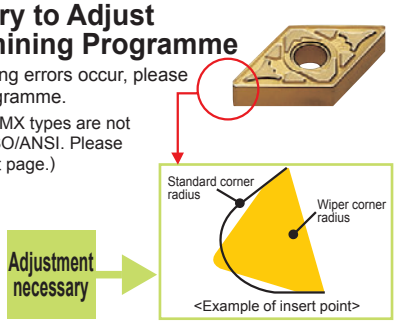


Ex):Theoretical surface roughness of holders in using the TNMX160412-MW.



■Necessary to Adjust the Machining Programme

When machining errors occur, please adjust the programme.
(The DNMX•TNMX types are not based on the ISO/ANSI. Please refer to the next page.)

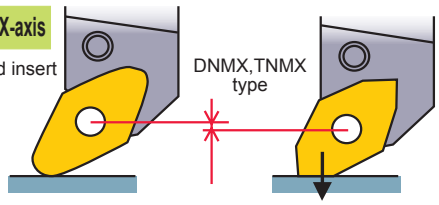


Adjustment of machining programmes for DNMX • TNMX types

Basic Process) Adjusting Toward X-axis and Z-axis

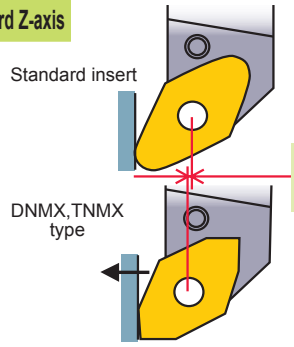
Adjusting the differential between a standard insert and Z-axis / X-axis.

Adjustment toward X-axis



Corner radius 0.4,0.8: **0.04 mm**
Corner radius 1.2 : **0.05 mm**

Adjustment toward Z-axis



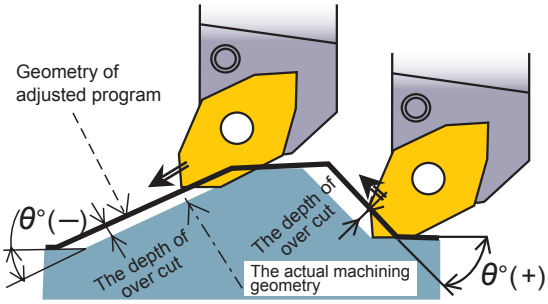
(Not closed to Corner R)
0.01mm

A) Adjusting a Taper

*Necessary to maintain a correct taper.

Adjust the relief angle toward the normal line.

Note) Adjust the angle toward the normal line in the case where the adjustment number is minus (θ =60°—70°) and is not machined completely.



Classification

Corner radius	Taper Angle θ°															
	-25—-15	-10	-5	**0**	5	10	15	20—35	40	45	50	55	60—65	70	75—85	**90**
1.2	0.04	0.03	0.01	**0**	0.02	0.03	0.04	0.05	0.04	0.04	0.02	0.01	-0.01	0	0.01	**0**
0.8	0.03	0.02	0.01	**0**	0.01	0.02	0.03	0.04	0.03	0.03	0.02	0	-0.01	0	0.01	**0**
0.4	0.02	0.01	0.01	**0**	0.01	0.01	0.02	0.02	0.02	0.01	0.01	0	-0.01	-0.01	0	**0**

The number→+numbers:adjustment of relief angle, -numbers:adjustment of drive-in angle (mm)

B) Adjusting a Corner R

*Necessary to maintain a correct corner radius.

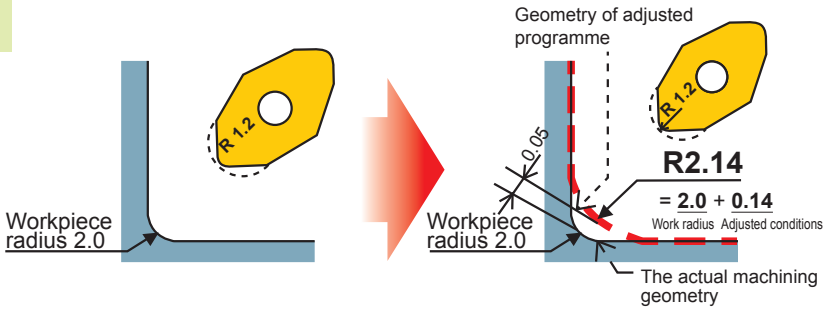
Adjust the work diameter same as the taper to prevent cut-over.

The value of adjustment to work R = Work R + the adjustment value

*No adjusting the corner radius in this case.

The corner radius of the insert	The adjustment amount on the workpiece radius.
Corner Radius 0.4 →	Work Radius**+0.05**(mm)
Corner Radius 0.8 →	Work Radius**+0.11**(mm)
Corner Radius 1.2 →	Work Radius**+0.14**(mm)

Ex) : In case of machining R 2.0 when using a corner R 1.2 type insert.



The Easy-to-correct Method

In correcting corner radius:
It is not necessary to adjust the machining programme, however, machining errors can occur within max. ±0.03mm due to correcting by an approximate number.

Corner Radius Correction

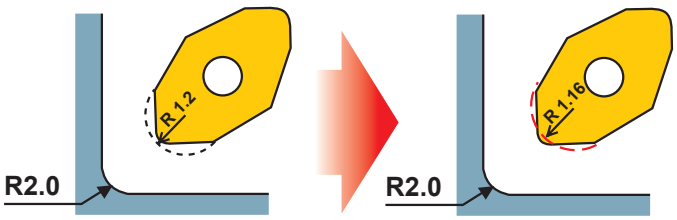
Input the correction number of each corner radius.

The value of corrected corner radius = approximation

*No adjusting the machining the programme in this case.

The corner radius of a insert	The value of corrected corner radius = approximation
Corner Radius 0.4 →	**R0.36**(mm)
Corner Radius 0.8 →	**R0.76**(mm)
Corner Radius 1.2 →	**R1.16**(mm)

Ex):In the case of machining a corner with a radius R 2.0 when using an insert with a corner radius R 1.2.



Others) The value of correction is same for both DNMX and TNMX. Discriminate them by the size of corner radius.

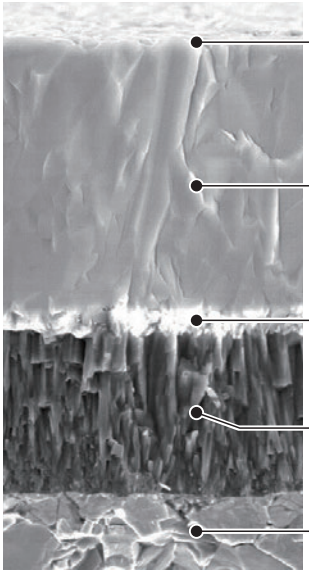
High reliability for a wide range of steel machining.

MC6015

Nano-Texture Technology
The optimised crystal growth, Nano-Texture coating technology gives outstanding wear and chipping resistance.

TOUGH-Grip Technology
The interface between the layers is controlled at the nano level, allowing the TOUGH GRIP layer extremely high levels of adhesion to prevent delamination.



Smooth coating surface
Prevents abnormal damage, welding and chipping

Ultra thick layer Nano-texture Al_2O_3
Delivers outstanding wear resistance even at high temperature

TOUGH-Grip
Prevents delamination of a coating

Nano-texture TiCN
Provides superior wear resistance and chipping resistance

Special carbide substrate
Prevents crack development
Stable tool life

GRADE CHARACTERISTICS

Grade	Substrate			Coating Layer

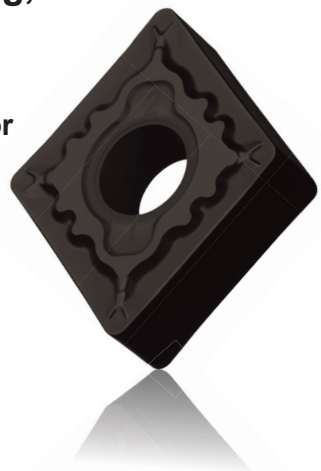
* 1GPa=102kg/mm^2

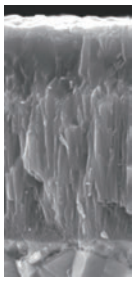
For interrupted cutting, medium to low surface speeds

MC6035

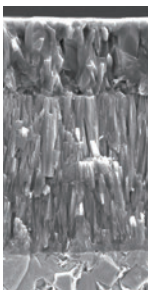
Prevents severe damage for increased stability

The smooth coating surface provides excellent welding resistance.
With the thickened TiCN, MC6035 also achieves superior wear resistance for increased stability.





MC6035



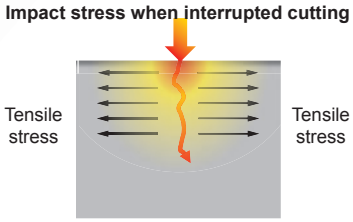
MC6025

The smooth coating surface provides excellent welding resistance.
With the thickened TiCN, MC6035 also achieves superior wear resistance for increased stability.

Reducing the effect of severe fracturing

By reducing the tensile stress in the coating layer during interrupted cutting, crack development caused by impact stress is prevented.

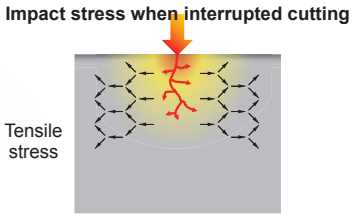
Impact stress when interrupted cutting



Conventional coating

Conventional products tend to result in fracturing because impact stress is transmitted deep into the coating layer during interrupted cutting.

Impact stress when interrupted cutting



MC6035

MC6035 has succeeded in alleviating tensile stress in the coating layer therefore, cracks that can develop by impact stress can be prevented when interrupted cutting.

COATED CARBIDE(PVD)

- PVD coating prolongs tool life under the same cutting conditions compared to uncoated carbide.
- Coating of tools with sharp edges is possible without softening or changing the edge quality of the substrate.

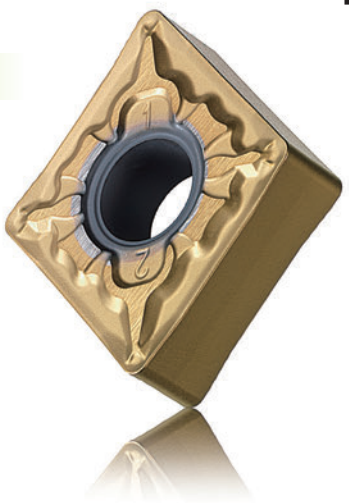
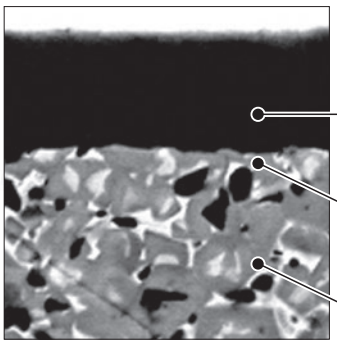
K	Cast Iron Ductile Cast Iron	Finishing	**VP25N** **AP25N**	160 (110 — 230)	K01 K10 K20	VP25N, AP25N

Effective for production of small parts.

MP3025

MP3025 provides improved adhesion for coating layer due to the newly-developed special substrate. Uniform flank wear allows prolonged machining that maintains excellent surface finish.





Ti-compound PVD coating provides excellent wear and welding resistance.

Substrate surface provides excellent adhesion strength for coating layer.

Substrate with superior fracture resistance and thermal shock resistance.

CEMENTED CARBIDE

●UTi grades are available for steel and cast iron. HTi grades are available for non-ferrous and non-metal materials and are also suitable for cast iron.

Rough Cutting	M	RK	**For rough cutting of carbon steel, alloy steel and stainless steel** Seating surface and wide land 3 or more times that of conventional products and provide high cutting stability for interrupted machining and scale removal.	Cast Iron  		RS 	**First recommendation for rough cutting of difficult-to-cut materials** Positive land increases welding resistance and suppresses chip welding and abrasion at low speed cutting.	 		GH	**For rough cutting of carbon steel, alloy steel and stainless steel** Double sided chipbreaker. For interrupted cuts and removing scale. A combination of wide land and a large chip pocket allows high feed rates.	Carbon Steel • Alloy Steel  		GJ	**First recommendation for rough cutting of difficult-to-cut materials** Double sided chipbreaker. Excellent balance of edge sharpness and strength. Edge geometry with high face wear resistance.	Difficult-to-Cut Materials  Heavy Cutting	M	HZ	**First recommendation for heavy cutting of mild steel and stainless steel** Single sided chipbreaker. Covers the lower end of the heavy cutting region. Low cutting resistance due to positive land and curved edge. Teardrop dots improve chip control without increasing cutting resistance.	Mild Steel  		NEW HL 	**First recommendation for mild steel and stainless steel** Low resistance due to narrow flat land. Achieves high chip breaking ability.	Mild Steel  		NEW HM	**Assist breaker for mild steel and stainless steel** Flat land provides outstanding balance between cutting edge strength and sharpness.	Mild Steel  		HX	**First recommendation for heavy cutting of carbon steel and alloy steel** Single sided chipbreaker. Covers the medium range of the heavy cutting region. Owing to the straight edge and chamfer, it gives a balance of sharpness and strength. Variable land and a wavy chipbreaker for good chip control.	Carbon Steel • Alloy Steel  		NEW HR	**Assist breaker for general steel and alloy steel** High cutting edge strength. Excellent chip discharge even with high feed and high depth of cut.	Carbon Steel • Alloy Steel

Finish Cutting	M	FP	**First recommendation for finishing carbon steel and alloy steel** Breaker protrusion at the corner tip controls chips even at small depth of cut. Maintains the edge strength at the corner and prevents sudden fractures.	Carbon Steel • Alloy Steel  		FM	**First recommendation for finishing stainless steel** Breaker protrusion at the corner tip controls chips even at small depth of cut. Maintains the edge strength at the corner and prevents sudden fractures.	Stainless Steel  		FV	**First recommendation for finishing carbon steel, alloy steel, mild steel and stainless steel** Suitable for low depths of cut and low feed rates. Sharp cutting edge and low resistance design achieves excellent cutting performance.	Carbon Steel • Alloy Steel  	G	R/L-F	**Finishing** Lead chipbreaker controls chip flow. Sharp cutting edge gives a good surface finish.	Carbon Steel • Alloy Steel  Light Cutting	M	LP	**First recommendation for light cutting of carbon steel and alloy steel** Sharp cutting edge due to a large rake angle. Prevents welding of the insert and controls white turbidity of the surface finish. Breaker protrusion suitable for depth of cut area achieves a wide range of chip control.	Carbon Steel • Alloy Steel  		LM	**First recommendation for light cutting of stainless steel** Sharp cutting edge due to a large rake angle. Prevents welding of the insert and controls white turbidity of the surface finish. Breaker protrusion suitable for depth of cut area achieves a wide range of chip control.	Stainless Steel  		SV	**Light cutting of carbon steel, alloy steel, mild steel and stainless steel** Large rake angle provides sharp cutting action. A peninsular dot ensures chip control at depths of cut under 1mm.	Carbon Steel • Alloy Steel  Medium Cutting	M	MK	**First recommendation for medium cutting of cast iron** Optimum balance between sharpness and high edge strength for general use.	Cast Iron  		MP	**First recommendation for medium cutting of carbon steel and alloy steel** Good balance of wear resistance and fracture resistance because of the flat land cutting edge. A wide chip pocket controls increasing of the cutting resistance and reduces vibration and chip jamming even at large depth of cut.	Carbon Steel • Alloy Steel

COATED CBN SERIES

BC8100 Series

FEATURES

The BC8100 series of CBN coated materials for machining hardened steel uses a newly-developed CBN substrate together with a special coating. The CBN substrate employs new "Ultra Micro-particle Binder" technology to successfully prevent sudden fractures during cutting and achieve long tool life. The coating consists of a special PVD coating suitable for various cutting types, which exhibits outstanding fracture resistance and wear resistance.

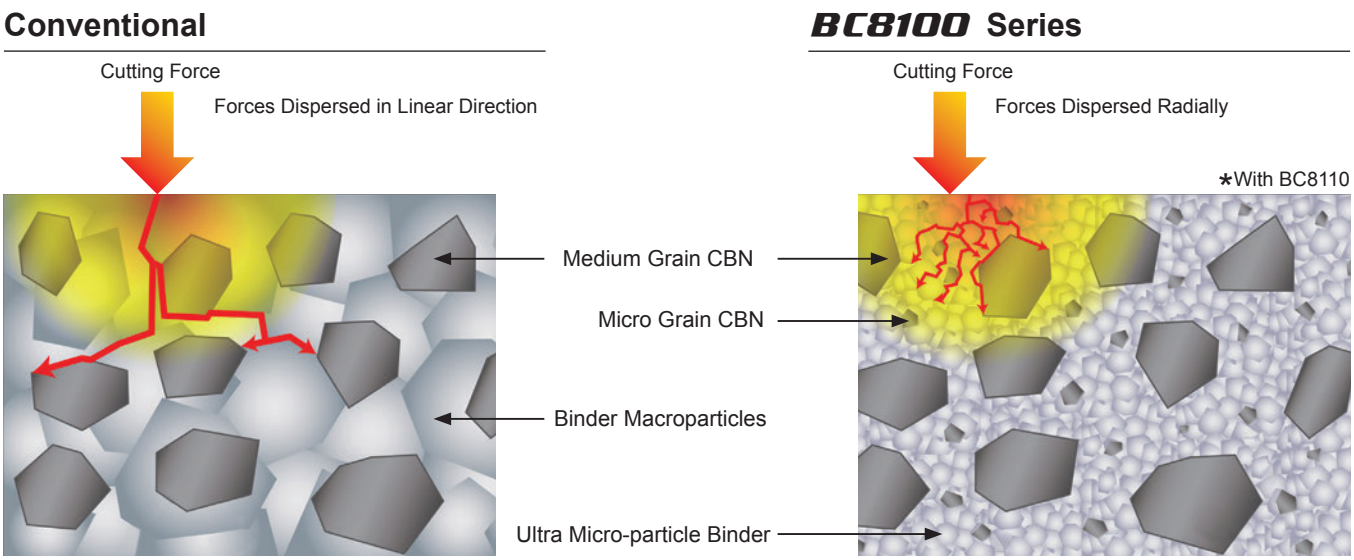
New technology

New Advanced Ceramic Coating

Uses a newly-developed special PVD ceramic coating suitable for various cutting types. Furthermore, optimization of the coating conditions has improved the adhesive strength of the CBN sintered body to the coating, to provide stable machining.Uses a newly-developed special PVD ceramic coating suitable for various cutting types. Furthermore, optimization of the coating conditions has improved the adhesive strength of the CBN sintered body to the coating, to provide stable machining.

*Graphical representation.

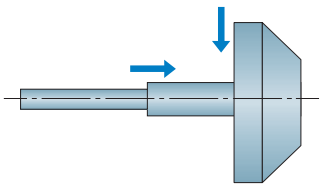
Optimised Substrate Technology



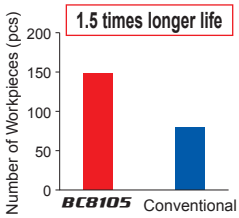
The new ultra micro-particle binder prevents linear crack development to avoid sudden fracturing.

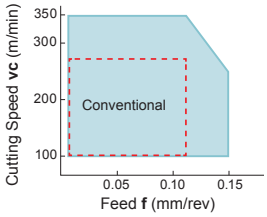
NEW BC8105

For machining focused on finished surface roughness
For Super Finish Cutting
Excellent surface finishes and close tolerances with long tool life
For surface finishes up to Rz 2.4μm (Ra 0.6μm)



Rz max 4.8

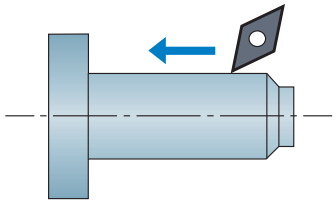


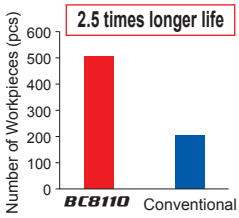


Insert : NP-CNGA120408GSWS2
Component : Pinion gear
Cutting Speed : 160 m/min
Feed : 0.35 mm/rev
Depth of Cut : 0.15 mm
Cutting Mode : Dry Cutting

BC8110

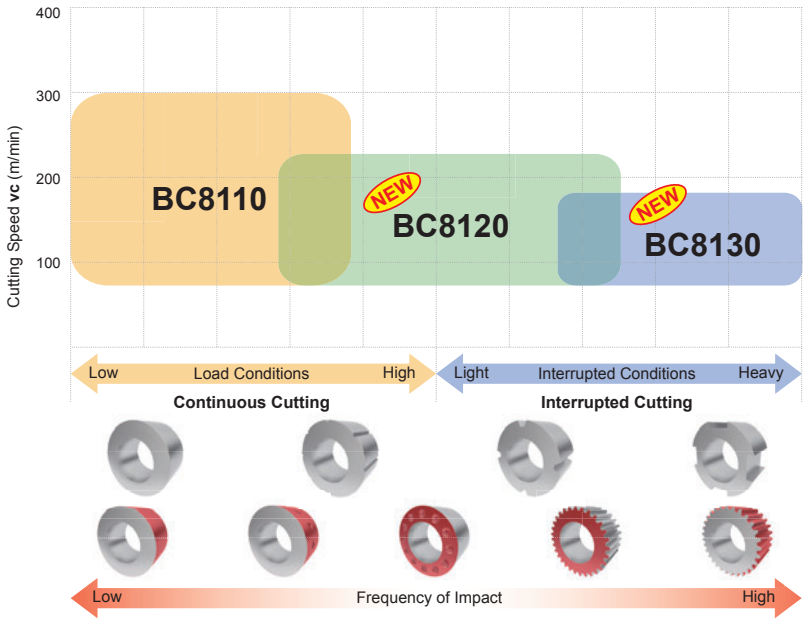
For Continous Cutting
Highest wear resistance of the series, suitable for continuous cutting.





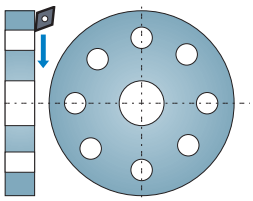
Insert : NP-DNGA150404FS2
Component : Shaft
Cutting Speed : 160 m/min
Feed : 0.2 mm/rev
Depth of Cut : 0.2 mm
Cutting Mode : Wet Cutting

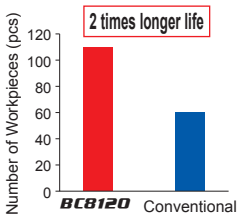
*BC8110 is recommended to improve wear resistance.



NEW BC8120

For Continuous to Medium Interrupted Cutting
1st choice for roughing and pre-finishing

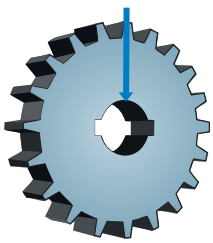


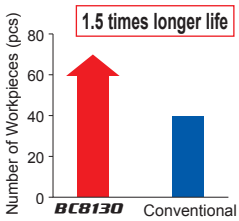


Insert : NP-CNGA120408TA2
Component : Clamp cylinder
Cutting Speed : 130m/min
Feed : 0.08mm/rev
Depth of Cut : 0.5mm
Cutting Mode : Wet Cutting

NEW BC8130

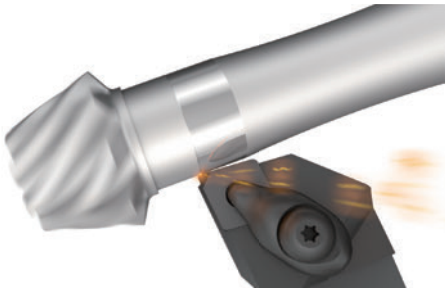
For Unstable Applications and Heavy Interrupted Cutting
Tolerance accuracy held over a high no. of impacts





Insert : NP-CNGA120408TH2
Component : Gear
Cutting Speed : 130m/min
Feed : 0.08mm/rev
Depth of Cut : 0.15mm
Cutting Mode : Wet Cutting

NEW BC8105 Highest Accuracy

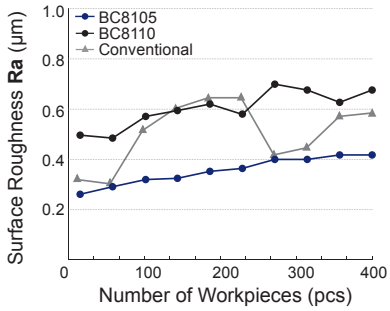


FEATURES

Use of a CBN substrate with excellent wear resistance and chipping resistance, together with a high-lubricity coating film, controls the occurrence of boundary wear and exhibits outstanding surface roughness.

Surface Finish

Insert	NP-DNGA150608GS2
Work Material	JIS SMn433 (60HRC)
Machining Methods	External Continuous Cutting
Cutting Speed **vc** (m/min)	176
Feed **f** (mm/rev)	0.09
Depth of Cut **ap** (mm)	0.15
Cutting Mode	Wet (Emulsion)

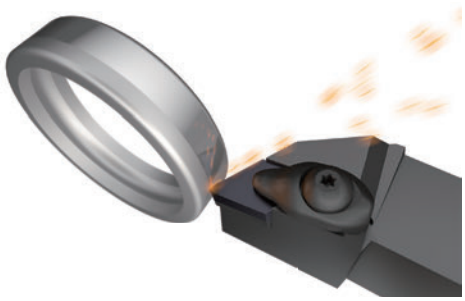


BC8105 can maintain excellent surface roughness.

RECOMMENDED CUTTING CONDITIONS

Work Material	Machining Methods	Cutting Speed vc (m/min)	f (mm/rev)	ap (mm)	Cutting Mode
Hardened Steel (Heat Treated Steel etc)	External Continuous Cutting	50 – 100 – 200 – 300 – 400	≦ 0.15	≦ 0.2	Dry, Wet

BC8110 High Speed Turning



FEATURES

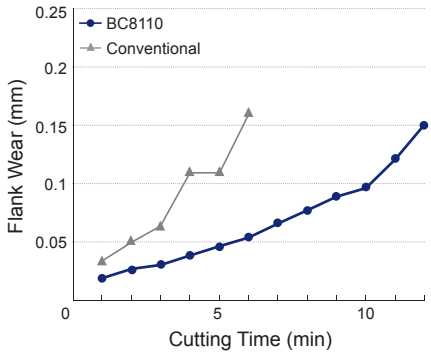
Use of a CBN substrate with excellent wear resistance and chipping resistance, together with an extremely hard coating film, provides the highest flank wear resistance of the entire BC81 series.

For Continuous Cutting

Covers a wide application range for continuous cutting

Tool Life (Flank Wear)

Insert	NP-CNGA120408GS2
Work Material	JIS SCr420 (60HRC)
Machining Methods	External Continuous Cutting
Cutting Speed **vc** (m/min)	250
Feed **f** (mm/rev)	0.10
Depth of Cut **ap** (mm)	0.2
Cutting Mode	Dry



Achieves long tool life for continuous cutting of hardened steel.

RECOMMENDED CUTTING CONDITIONS

Work Material	Machining Methods	Cutting Speed vc (m/min)	f (mm/rev)	ap (mm)	Cutting Mode
Hardened Steel (Heat Treated Steel etc)	External Continuous Cutting	50 – 100 – 200 – 300 – 400	≦ 0.20	≦ 0.35	Dry, Wet

NEW BC8120 General Application

FEATURES

Use of a CBN substrate with excellent fracture resistance and crater wear resistance, together with a coating film having superior wear resistance, combines both fracture resistance and wear resistance while exhibiting outstanding crater wear resistance.

For Continuous and Light Interrupted Cutting

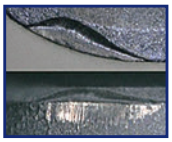
1st choice for roughing and pre-finishing

Covers a wide application range between continuous and light-interrupted machining

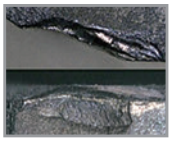
Test of Interrupted Cutting

Insert	NP-CNGA120408GA2
Work Material	JIS SCr420 (60HRC)
Machining Methods	External Interrupted Cutting
Cutting Speed **vc** (m/min)	250
Feed **f** (mm/rev)	0.15
Depth of Cut **ap** (mm)	0.1
Cutting Mode	Dry

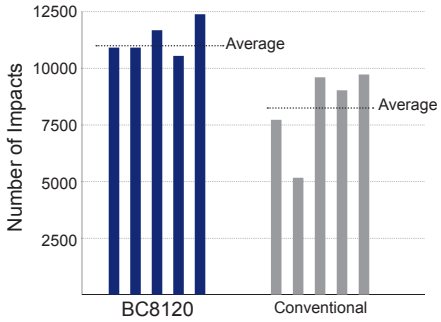
Cutting edge condition after 8000 impacts



BC8120



Conventional



Number of Impacts Before Fracturing

RECOMMENDED CUTTING CONDITIONS

Work Material	Machining Methods	Cutting Speed vc (m/min) (50 – 100 – 200 – 300)	f (mm/rev)	ap (mm)	Cutting Mode
Hardened Steel (Heat Treated Steel etc)	External Continuous Cutting		≦ 0.3	≦ 0.5	Dry, Wet
	External Interrupted Cutting		≦ 0.2	≦ 0.3	Dry, Wet

NEW BC8130 Tough Machining

FEATURES

Use of a CBN substrate with excellent cutting edge strength, together with a coating film that combines hardness with impact resistance, allows it to exhibit outstanding cutting edge strength and fracture resistance.

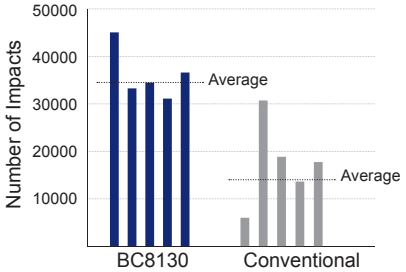
For Unstable Applications and Heavy Interrupted Cutting

Tolerance accuracy maintained over a high number of impacts

Heavy Interrupted Cutting (Laboratory Test)

Insert	NP-CNGA120408GA2
Work Material	JIS SCr420 (60HRC)
Machining Methods	External Heavy Interrupted Cutting
Cutting Speed **vc** (m/min)	250
Feed **f** (mm/rev)	0.05
Depth of Cut **ap** (mm)	0.1
Cutting Mode	Wet

BC8130 provides stability up to 30000 impacts



Number of Impacts Before Fracturing

RECOMMENDED CUTTING CONDITIONS

Work Material	Machining Methods	Cutting Speed vc (m/min) (0 – 50 – 100 – 150 – 200)	f (mm/rev)	ap (mm)	Cutting Mode
Hardened Steel (Heat Treated Steel etc)	External Interrupted Cutting		≦ 0.20	≦ 0.30	Dry, Wet

MBC010/MBC020

Grade	Grade Features and Application	Main Component	Coating Layer
MBC010	**Coated CBN for High Speed Continuous Cutting** MBC010 makes the best use of special ceramic binder structure, actualizing high wear resistance. High wear resistance enables continuous machining at high speed of over 300m/min.	CBN (Micro Grain) TiN Al_2O_3	TiN
MBC020	**Coated CBN for general cutting** Uses a CBN substrate that has high cutting edge toughness. The TiAlN based coating delivers superb wear resistance. It covers a wide range of applications from continuous to light interrupted cutting.	CBN (Micro Grain) TiN Al_2O_3	TiAlN

MBC010

WEAR RESISTANCE

Dry Interrupted Cutting

Memo

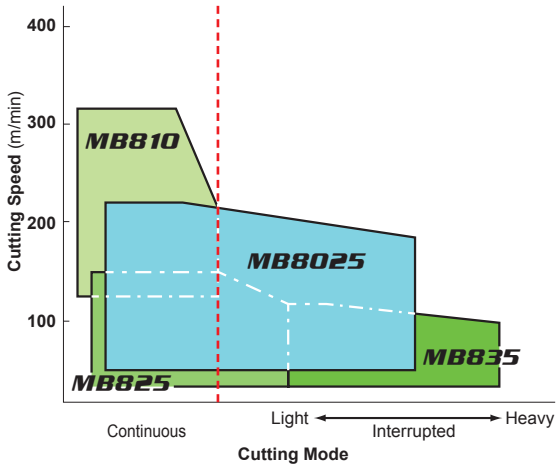
UNCOATED CBN SERIES

FEATURES

• CBN tool material is produced by mixing the main component CBN (cubic boron nitride), which has a hardness second only to diamond, with a special ceramic or metal binder. It is then sintered at a pressure of over 5GPa and at a temperature of 1200°C or higher.
• CBN has lower affinity to iron than diamond. The low affinity and high hardness properties means that sintered CBN delivers a superior cutting performance especially during high speed machining of materials such hardened steel, cast iron and sintered alloys etc.

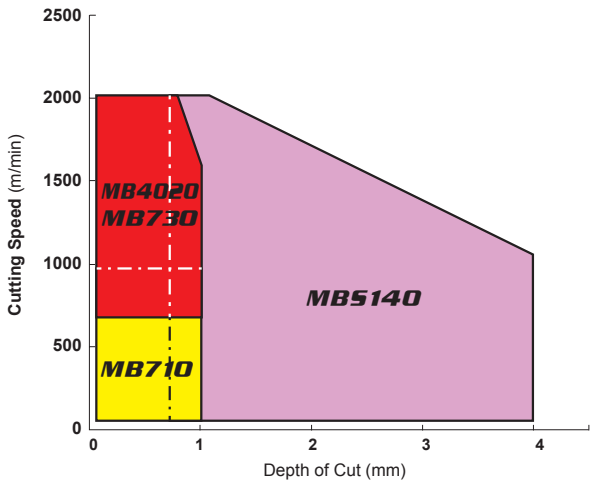
HARDENED STEEL MACHINING

Grade	Grade Features and Application	Main Component
MB8025	**For General Purpose Turning** By employing a "Particle-activated Sintering Method", the new sintered CBN technology is recommended for continuous cutting from medium to high speeds.	CBN (Micro Grain) TiN Al_2O_3
MB810	**For High Speed Continuous Cutting** It features improved wear resistance due to impregnation with larger CBN particles.	CBN (Coarse grain) TiN Al_2O_3
MB825	**For Continuous to Medium Interrupted Cutting** Excellent balance of wear resistance and fracture resistance due to introduction of micro-grain CBN particles.	CBN (Micro Grain) TiC Al_2O_3
MB835	**For Heavy Interrupted Cutting** Improved grade employing micro-grain CBN particles. Excellent fracture resistance for use in heavy interrupted cutting.	CBN (Micro Grain) TiN Al_2O_3



CAST IRON MACHINING

Grade	Grade Features and Application	Main Component
MB710	**For General Cutting** General purpose grade with well balanced wear and fracture resistance.	CBN TiC Al_2O_3
MB730	**For Continuous to Interrupted Cutting** Has the larger CBN content and therefore displays good thermal conductivity. It is suitable for the high temperatures that are generated in high speed cutting.	CBN (High Content) Co Base Alloy
MB4020	**For High Speed Cutting** Has the larger CBN content and therefore displays good thermal conductivity. From high-speed cutting to interrupted cutting are possible.	CBN (High Content) Co Base Alloy
MB5140	**For High Speed Cutting and Roughing of Cast Iron** Highest CBN content, high thermal conductivity. Enables deep depth of cut.	CBN AlN (Solid)
MB5015	MB5015 is exclusive grade for boring of Centrifugal casting Cylinder liners in semi finishing or finishing applications with high with high wear resistance.	



MB5140 Solid CBN grade for machining cast iron and sintered alloys

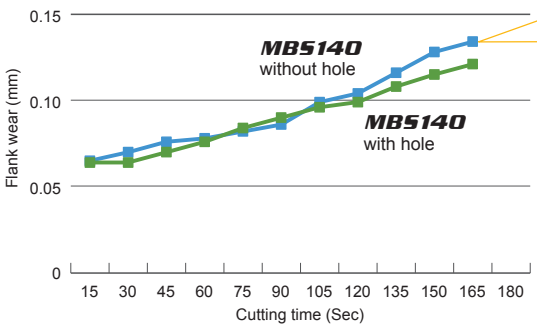
FEATURES

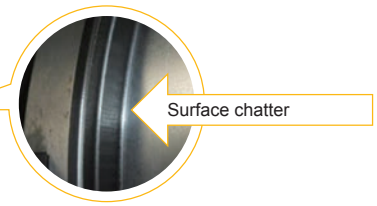
Supports high-efficiency machining with large depths of cut.

- Since all inserts are CBN sintered bodies, there are no limits to the depths of cut as with CBN brazing tools, allowing machining with large depths of cut.
- For rough machining of cast iron, high-speed, high-efficiency machining, which is a characteristic of CBN tools, can be achieved.

Combines wear resistance and fracture resistance

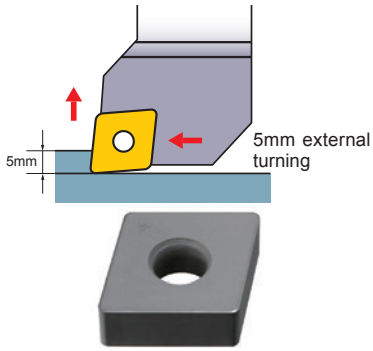
- Use of micro-grain CBN with a newly-developed special binder provides high wear resistance.
- Use of Mitsubishi's original high-efficiency sintering technology provides high fracture resistance and supports machining with large depths of cut.





<Cutting Conditions>
Workpiece : FC250 (DIN GG25)
Insert : CNGA120408/CNGN120408
Holder : Double Clamp Holder
Cutting Speed : 400 m/min
Feed : 0.05 mm/rev
Depth of Cut : 5.0 mm
Dry Cutting

Addition of insert series equipped with holes
Comparison of depth of cut
5mm face turning



MB5015 For Cylinder liner *Poduced to order only.

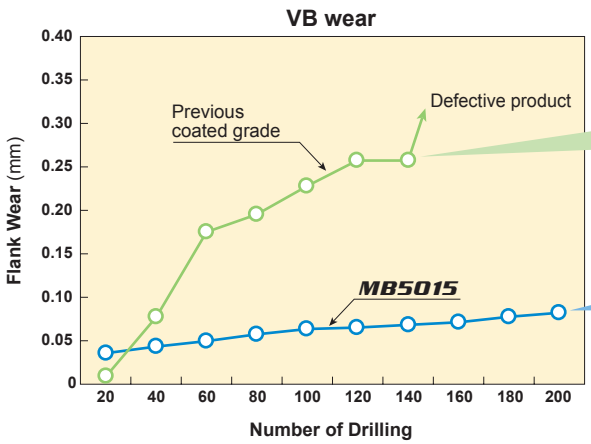
FEATURES

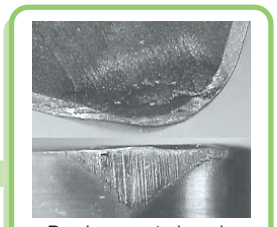
- **MB5015** is exclusive grade for boring of Centrifugal casting Cylinder liners in semi finishing or finishing applications with high with high wear resistance.

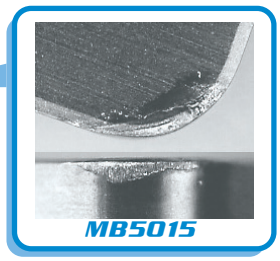
RECOMMENDED CUTTING CONDITIONS

Work Material		Cutting Mode	Cutting Speed (m/min) 100 500 1000 1500	Feed (mm/rev)	Depth of Cut (mm)	Coolant
Centrifugal casting	Cast Iron	Continuous cutting		–0.3(Finishing) –0.8(Semi-finishing)	–0.05(Finishing) –0.2(Semi-finishing)	Wet

CUTTING PERFORMANCE





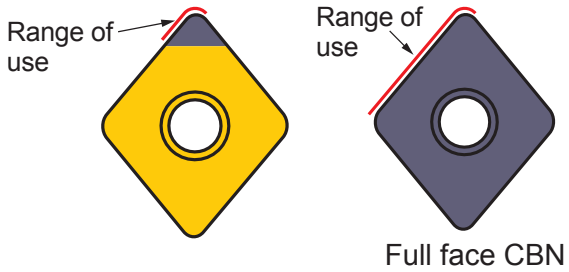


<Cutting Conditions>
Workpiece : FC200 (Centrifugal casting) ϕ63.0
Cutting Speed : 800m/min Feed : 0.35mm/rev Depth of Cut : 0.03mm
Work : Centrifugal casting Cylinder liner Hole Depth : 100mm

MB4020 SINTERED ALLOY MACHINING

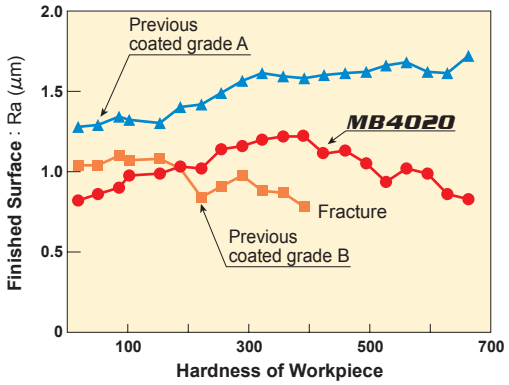
Full face CBN

Full face CBN insert can be used for chamfering that use higher depth of cut



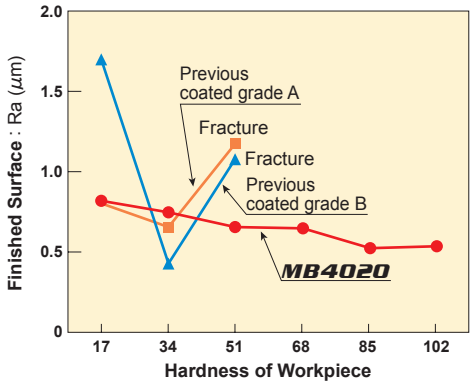
CUTTING PERFORMANCE

Continuous cutting of high density sintered alloy



<Cutting Conditions>
Workpiece : High density sintered alloy Insert : NP-CNGA120408
Cutting Speed : 190m/min Feed : 0.15mm/rev
Depth of Cut : 0.1mm
Wet Cutting

Continuous cutting of sintered alloy



<Cutting Conditions>
Workpiece : Sintered alloy Insert : NP-CNGA120408
Cutting Speed : 100m/min Feed : 0.15mm/rev
Depth of Cut : 0.1mm
Wet Cutting

APPLICATION EXAMPLE

Insert		NP-TNGA160404SF3	NP-CNGA120404SE2	CCGW060204FS
Workpiece		 Carburized and quenched alloy	 Carburized and quenched alloy	 FC250
Component		Variable valve parts	Variable valve parts	Crankcase
Cutting Conditions	Cutting Speed (m/min)	250	250	400→450
	Feed (mm/rev)	0.1	0.12	0.03→0.37
	Depth of Cut (mm)	0.2	0.2	0.13
	Coolant	Wet cutting	Wet cutting	Wet cutting
Result				
CBN

- Suitable for high speed finishing of heat treated steel, sintered ferrous alloy and cast iron.
- Low affinity to iron, thus good surface finishes are possible.
- Grinding can be replaced by machining.

●Heat Treated Steel

Work Material		Type	Cutting Mode	Recommended Grade	Recommended Cutting Conditions

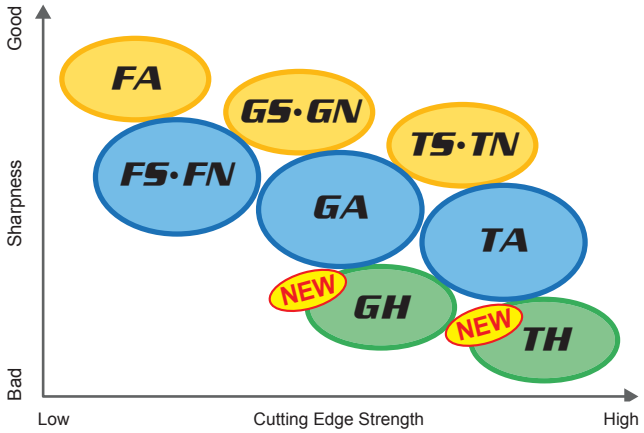
HONING

Honing for machining hardened steel

For the CBN **BC8020**, **MBC010** and **MBC020** coated grades, **MB4020** and **MB710/MB730** a wide range of edge honing styles are available to cover a large range of applications and to represent Mitsubishi Materials' unique cutting tool technology.



General cutting

GA Honing : General machining
GS Honing : Vibration and burr control
GN Honing : If the crater wear is large.
GH Honing : For depths of cut of 0.15 or greater

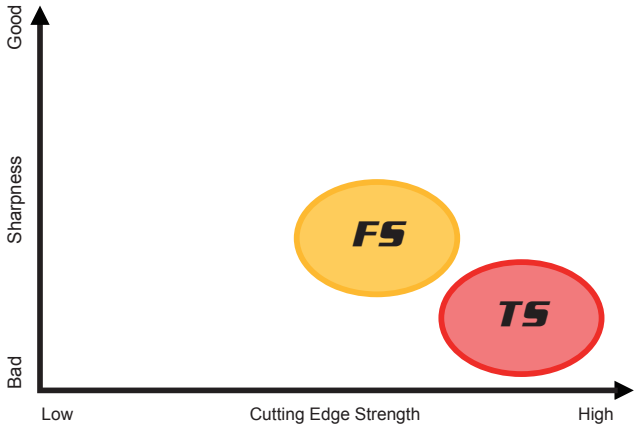
Continuous cutting, stable cutting

FS Honing : General machining
FA Honing : For improved biting compared to **FS**
FN Honing : if the crater wear is large.

Medium and heavy interrupted cutting, unstable cutting

TA Honing : General machining
TS Honing : Vibration and burr control
TN Honing : If the crater wear is large.
TH Honing : For depths of cut of 0.15 or greater

Honing for machining sintered alloys



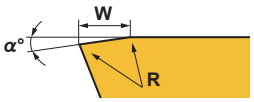
Continuous cutting, stable cutting

FS Honing : Continuous cutting, General machining

Medium and heavy interrupted cutting, unstable cutting

TS Honing : If fracturing occurs at the blade edge during interrupted cutting

NP-CNGA120408-G A 2



Main Application — Edge Honing Type

	A General			S Vibration and burr control			N Crater wear control			H High efficiency		
	α	W	R	α	W	R	α	W	R	α	W	R
F Continuous cutting	15	0.1	0	15	0.1	0.01	15	0.05	0.01	—	—	—
G General cutting	25	0.13	0.03	25	0.13	0.01	25	0.05	0.01	25	0.27	0.03
T Interrupted cutting	35	0.13	0.03	35	0.13	0.01	35	0.05	0.01	35	0.27	0.03

※ Conventional honing shapes
F honing : 0.1mm×15°+R0
G honing : 0.13mm×25°+R0.03
T honing : 0.13mm×35°+R0.03

CBN GROOVING SERIES(GY/MG)

FEATURES

A combination with a high rigidity holder ensures high accuracy and long tool life.

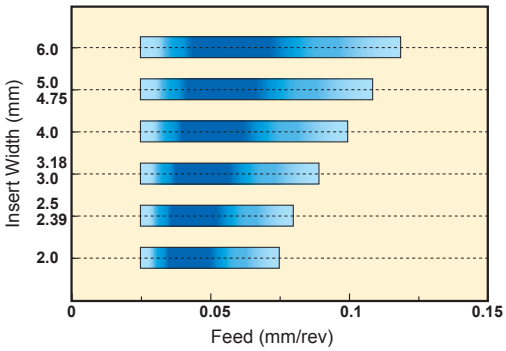
Holder rigidity is essential when grooving hardened steel. The GY series Tri Lock system offers high rigidity equivalent to a 1-piece type despite being a 2-piece type. MG has a wide insert location face for high gripping force. A combination with these holders allows it to deliver excellent performance when grooving hardened steel.

NEW

BC8110 coated materials for continuous machining of hardened steel have been added to GY inserts.

BC8110 materials with excellent wear resistance have been added. Compared to conventional materials, they display excellent wear resistance to achieve long tool life. A blade width of 6.0 has also been added to the lineup of BC8110.

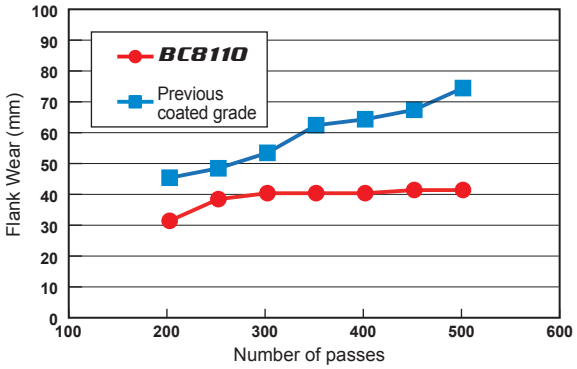
RECOMMENDED CUTTING CONDITIONS



Work Material		Hardness	Grade	Cutting Speed (m/min)	Coolant
H	Hardened Steel	35－65HRC	**BC8110** **MB8025**	100 (60－120)	Dry,Wet

CUTTING PERFORMANCE

Tool life evaluation for the GY holder



<Cutting Conditions>

Insert	: GY1G0200D020N-GFGS
Workpiece	: SCr420 (60HRC)
Cutting Speed	: 120 m/min
Feed	: 0.1 mm/rev
Depth of Cut	: 0.3 mm
Cutting Mode	: Dry Cutting

APPLICATION EXAMPLE

Insert		**GY1G0300F020N-GFGS** (Grade : **BC8110**)
Workpiece		 SNCM230H (HRC58–62)
Component		Input shaft
Cutting Conditions	Cutting Speed (m/min)	130
	Feed (mm/rev)	0.1
Result		 Tool life over twice as long as conventional products

CBN BREAKER INSERT

FEATURES

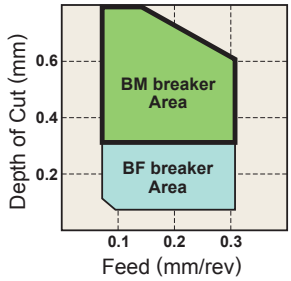
Chip Breaker Geometry Designed for Excellent Chip Control

Radial chip breaker ensures optimization of the cutting point and the chip breaker position. Enables effective chip discharge even when copy machining and prevents the chips from wrapping around the holder under finish cutting conditions.

Long Life Coated CBN Grade

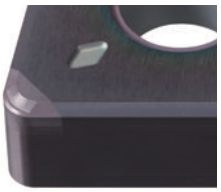
Combination of Coating grade & Breaker, high efficiency and long tool life in wide variety of applications.

APPLICATION AREA



DEEP CUTTING DEPTH

BM Breaker (Deep shoulder Milling)



Good for deep depth cutting of carburized layer.

Recommend and under ap=0.6mm

Available in BC8120 grade.

LIGHT CUTTING DEPTH

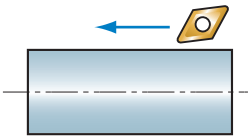
BF Breaker

Good for chip removal under light depth and feed cutting.

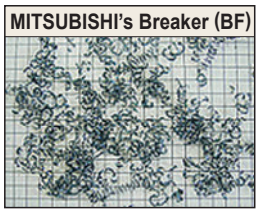
Recommend and under ap=0.3mm

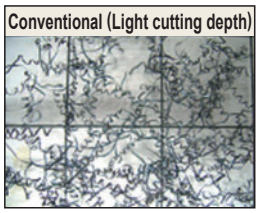
Available in BC8110,MBC020 grade.

CUTTING PERFORMANCE

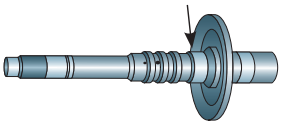


<Cutting Conditions>
Workpiece : JIS SCr420H (55HRC)
Insert : BF-CNGG120408TA4
Cutting Speed : 100m/min
Feed : 0.2mm/rev
Depth of Cut : 0.1mm
Dry Cutting

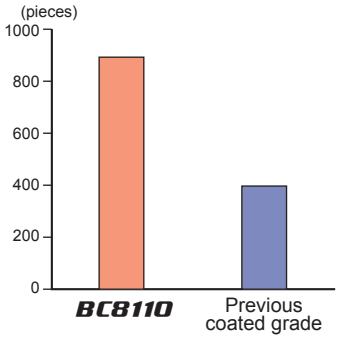




APPLICATION EXAMPLE



<Cutting Conditions>
Workpiece : SCr420H (61-65HRC)
Insert : BF-DNGM150404TA2
Cutting Speed : 150m/min
Feed : 0.12mm/rev
Depth of Cut : 0.15mm
Wet Cutting



MULTI-CORNER TYPE INSERTS

A single sided, multi-corner type insert has no cutting edges on the underside.

Double Sided, multi-corner type insert, ex.

NP-CNGA120408GA4

No. of Cutting Edge Corners

Single Sided, multi-corner type insert, ex.

No. of Cutting Edge Corners

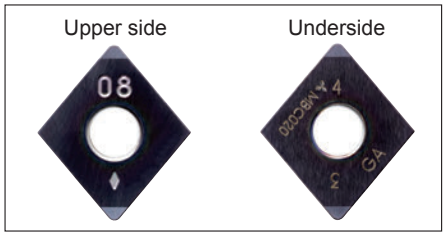
10-INSERTS PACKS

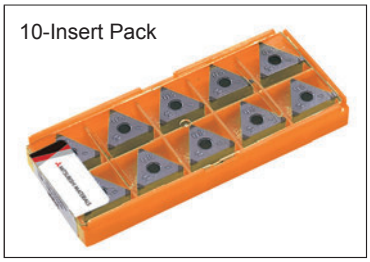
Two types of packs for ***MB8025*** Multi-corner type inserts, are available, a single insert pack and a ten insert pack. For easy storage.

TNP-CNGA120404G2

10-Insert Pack Symbol

Double sided, multi-corner type insert





WIPER INSERT

● Improving Surface Finish

Under the same machining conditions as conventional breakers, but with the feed rate increased, the surface finish of the workpiece can be improved.

● Improving Efficiency

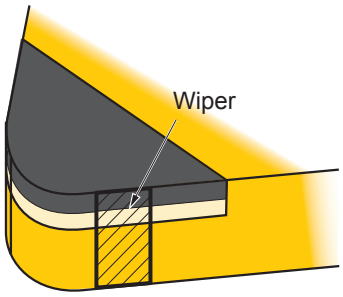
High feed rates not only shorten machining times but also make it possible to combine roughing and finishing operations.

● Increased Tool Life

When a change to high feed conditions, the time required to cut one component is decreased, thus more parts can be machined with each insert. In addition, the high feed rate prevents rubbing, therefore, delaying the progression of wear and increasing the tool life of the insert.

● Improving Chip Control

Under high feed conditions, the chips generated become thicker and are more easily broken, thus, chip control is improved.



Insert example

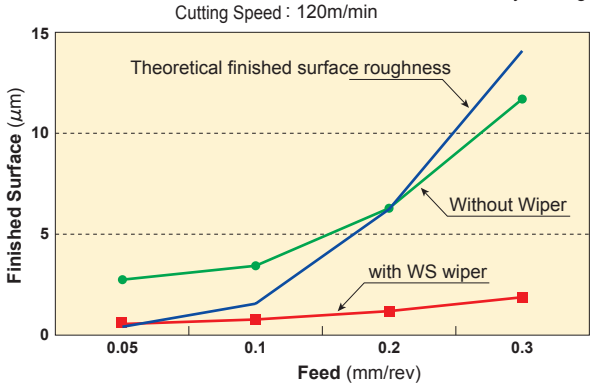
General wiper insert

NP-CNGA120408GAWS2

New wiper edge code

Cutting performance

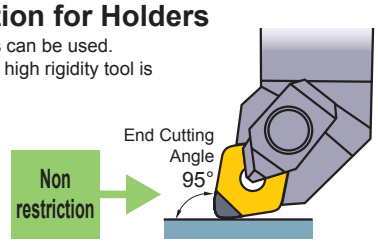
<Cutting Conditions> Workpiece : Hardened Material (HRC60) Depth of Cut : 0.1mm
Insert : NP-CNGA120408GAWS2 Dry Cutting
Cutting Speed : 120m/min



NOTES FOR USE

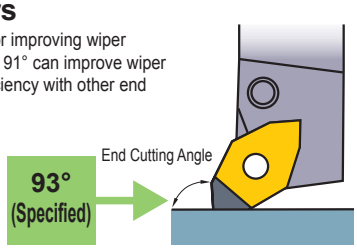
No Restriction for Holders

A standard holders can be used.
(*A double clamp, high rigidity tool is recommended.)

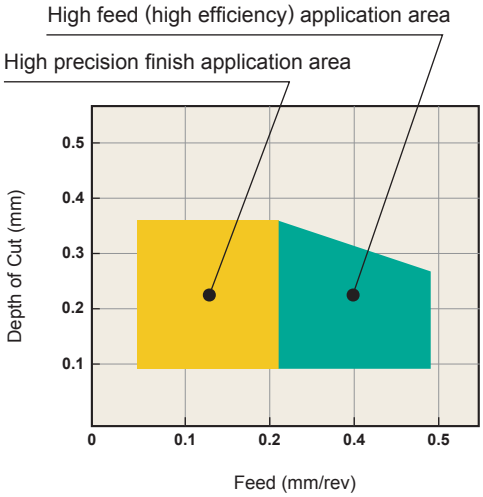


Restriction for Holders

Use a holder with end cutting angle 93° for improving wiper efficiency. A holder with end cutting angle 91° can improve wiper efficiency, however, there is no wiper efficiency with other end cutting angles (60°, 90°,107°etc.).

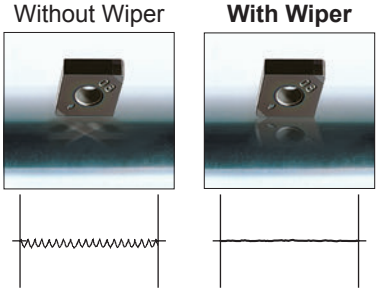


RECOMMENDED CUTTING CONDITIONS AND PERFORMANCE



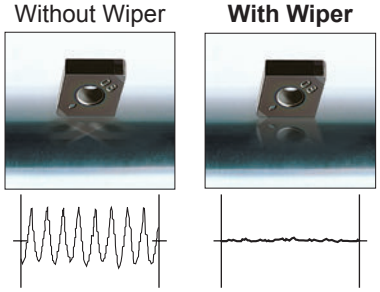
High precision finishing

Cutting Speed: 100m/min Feed: 0.1mm/rev
Depth of Cut: 0.1mm Dry Cutting



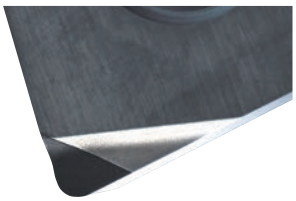
High feed, high efficiency machining

Cutting Speed: 100m/min Feed: 0.3mm/rev
Depth of Cut: 0.1mm Dry Cutting

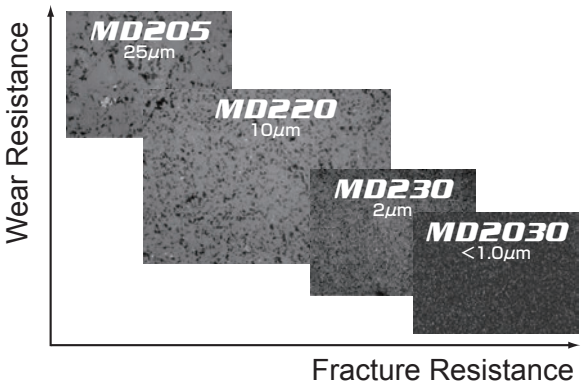


PCD(SINTERED DIAMOND)

- Suitable for materials such as aluminium alloy, non-ferrous metals, and fibre strengthened plastic.
- Suitable for extremely high speed finishing.



FEATURES



Grade	Features
MD205	**Materials focused on wear resistance** Coarse grain diamond particles are sintered and wear resistance is excellent. Use when wear resistance with MD220 is insufficient.
MD220	**Materials for general machining** Sintered medium grain diamond particles. Wear resistance and fracture resistance are superbly balanced. Applicable to general finishing of non-ferrous metals, non-metal cutting, and similar machining.
MD230	**Materials focused on fracture resistance** Fine grain diamond particles are used. Fracture resistance and cutting edge sharpness are excellent. Use when fracture and a high quality finished surface is demanded with MD220.
MD2030	**Special materials for milling** Strong sintering of ultra micro-grain PCD particles provides exceptional fracture resistance.Chipping during high-speed finish milling can be controlled.

SELECTION STANDARD

●TURNING

Work Material	Recommended Grade			Recommended Cutting Conditions		
	MD205	MD220	MD2030	Cutting Speed (m/min)	Feed (mm/rev)	Depth of Cut (mm)
Aluminium Alloy (Si ≤ 12%)		◎	○	800 (200—1200)	—0.2	—1.0
Aluminium Alloy (Si ≥13%)	◎	○		600 (200—1000)	—0.2	—1.0
Copper Alloy		◎		700 (200—1200)	—0.2	—1.0
Strengthened Plastic		◎		600 (100—1000)	—0.4	—1.0
Glass Fibre Reinforced Plastic		◎		500 (100—800)	—0.25	—1.0
Carbon	○	◎		400 (100—600)	—0.3	—1.0
Ceramics		○		50 (30—80)	—0.1	—1.0
Hard Rubber		◎		600 (300—800)	—0.15	—1.0
Wood Inorganic Board		◎		1300 (300—4000)	—0.4	—
Cemented Carbide	◎	○		15 (5—20)	—0.2	—0.5

(Note1) ◎ : 1st recommendation. ○ : 2nd recommendation
(Note2) Not suitable for steel.

NEW PETIT CUT INSERT SERIES

FEATURES

- **Economical** The small PCD delivers long tool life. Eliminates the need for regrinding, making tool management easier and economical.
- **With Breaker** Chip breaker formed directly on the PCD portion delivers superior chip control.
- Corner R0.05mm inserts are available, making it suitable for the machining of small work corner radii.

- The insert photos are only examples. The letters refer to the chip breaker and the bracketed dimension are refers to the inscribed circle.

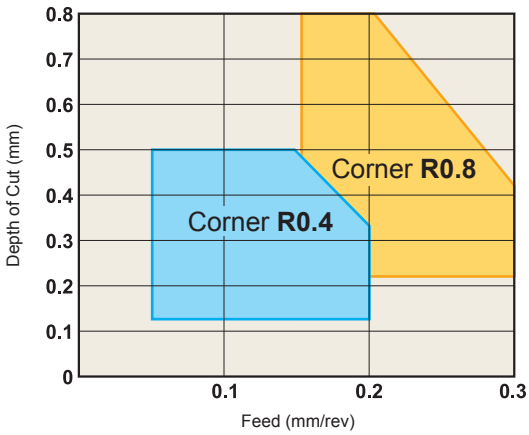
·RECOMMENDED CUTTING CONDITION

	Work Material	Hardness	Grade	Cutting Speed (m/min)
P	Mild Steel	≤180HB	**UE6020**	150−350
	Carbon Steel, Alloy Steel	150HB−250HB	**UE6020**	100−250

(Note) The above cutting conditions are general guidelines.
Adjustments maybe necessary depending on machine rigidity, workpiece geometry and clamping.

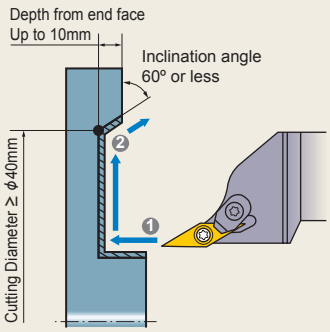
Applicable range



NOTE

Notes when end face copying

Pay special attention to the following when face copying.



●Machining of an outer diameter (Step ①)

- To prevent burr formation, the depth of cut should be below half the nose radius.

●Machining of an inclination (Step ②)

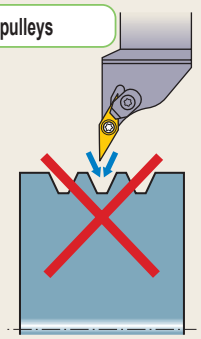
- To reduce the contact length of chips, the depth of cut should be below half the nose radius.
- To prevent interference between the tool and the workpiece, the cutting diameter should be 40mm or larger, inclination angle 60° or less and depth from the end face up to 10mm.

●When changing inserts

- When indexing the inserts, it is recommended to preset the cutting edge position to maintain machining accuracy.

Not possible

Machining of V-pulleys



When machining V-pulleys, use a VNMG insert.

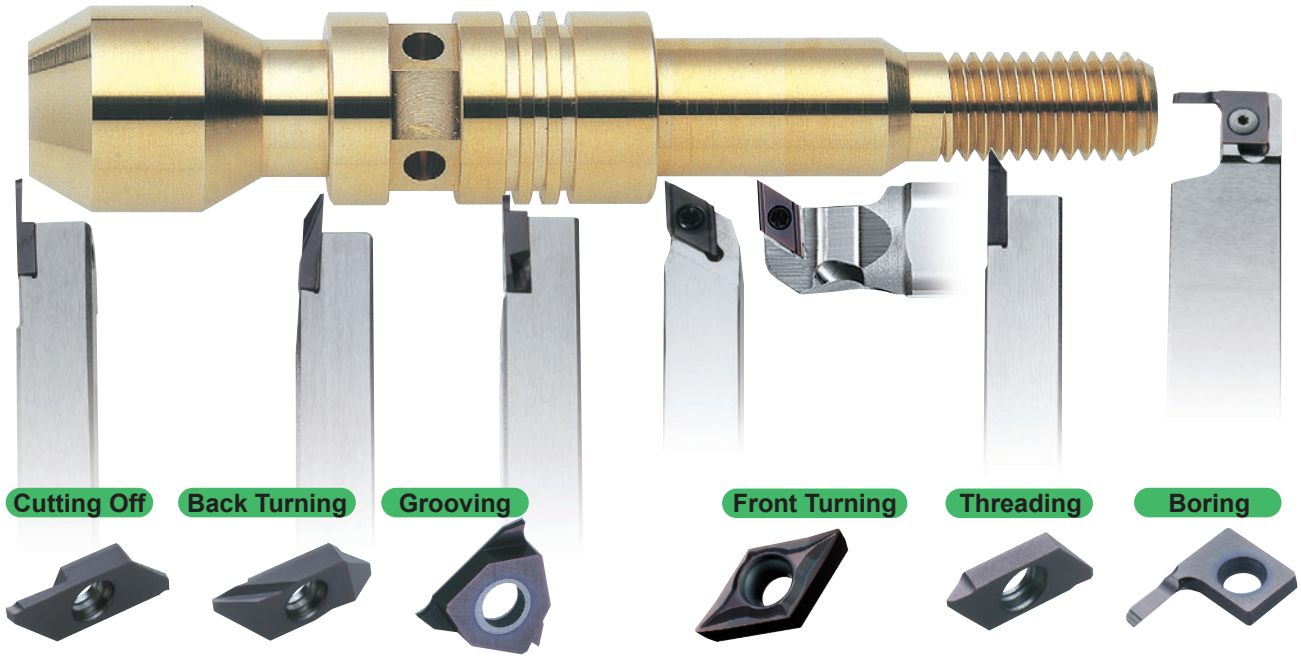
OUTLINE OF SMALL TOOLS

TOOLS FOR GANG TYPE AUTOMATIC LATHES (FOR EXTERNAL TURNING AND BORING)

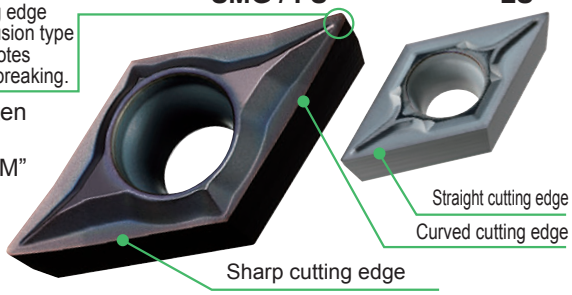


Molded Breaker Insert

Nose radii designed with minus tolerance

- Suitable for small parts applications that often require minus tolerance dimensions.
- The order number is shown with the letter "M" that indicates minus tolerance.
  <Ex>DCGT11T301M-FS
- The radius value is printed on the side of the insert label for easy recognition.

A combination of a curved cutting edge and the protrusion type breaker promotes efficient chip breaking.

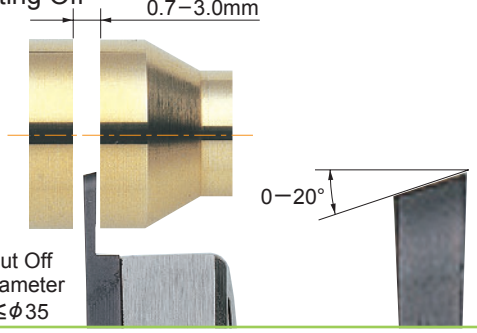


Tolerance Corner R

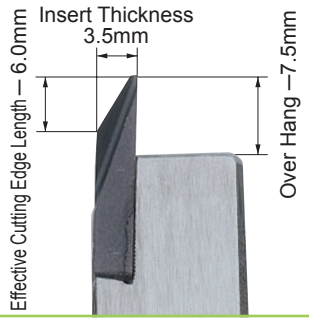
E class
RE $^{0}_{-0.02}$ mm

"M"-mark inserts
RE $^{0}_{-0.05}$ mm
(Conventional G-class insert RE ±0.10 mm)

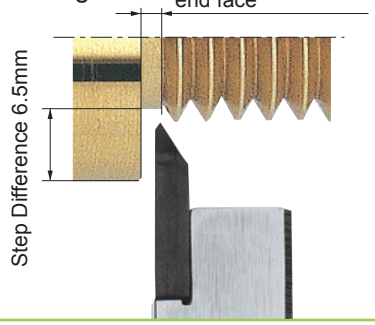
Cutting Off



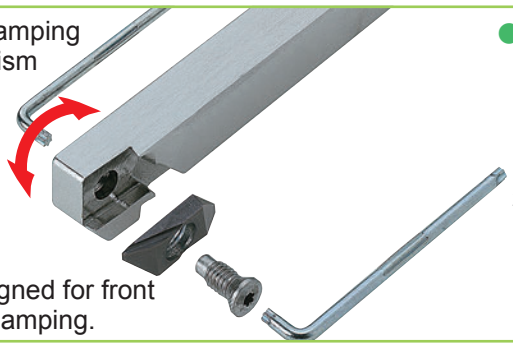
Back Turning



Threading



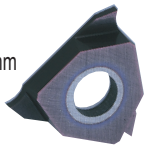
Back Clamping Mechanism

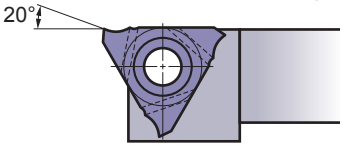


Screw designed for front and back clamping.

Grooving

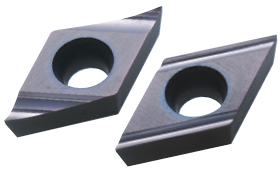
- 3-cornered
- Groove width 0.3−3.0mm
- Traversing possible





Front Turning

- ISO E class accuracy inserts
- A wide variety of small corner R inserts
- Rake angle 30°



Tools for a very wide range of small parts machining

External Turning	Tools for front turning, back turning, grooving, threading, and cutting off
Internal Turning	Tools for boring, internal grooving and internal threading
Drilling	Drills
End Milling	End Mills

Tools for CNC automatic and small lathes

Types of Tool Posts	Gang type, turret type, cam type (radial pattern type)
Tool Sizes	Square shank: 8–16 mm Round shank : less than ϕ25.4

Indexable inserts developed under the concept of "high quality, high efficiency and long tool life."

High Quality	E class tolerance, sharp cutting edge, high accuracy small corner R, smooth surface finish
Long Tool Life	COATED CARBIDE (PVD) MS6015/VP15TF/MP9005/MP9015
High Efficiency	Regrinding not necessary due to the employment of indexable inserts. A wide variety of top cutting edge geometries

TOOLS FOR CAM TYPE AUTOMATIC LATHES

- The most suitable for the use with cam type automatic lathes (radial pattern tool posts)
- The most suitable for machining of small parts with work diameter 5mm or smaller
- Single holder for front turning, back turning, grooving, threading and cutting off operations

Front Turning | Back Turning | Grooving | Threading | Cutting Off

INTERNAL TURNING TOOLS

Solid type ***MICRO-MINI TWIN Boring Bars***

Minimum cutting diameter ϕ2.2–

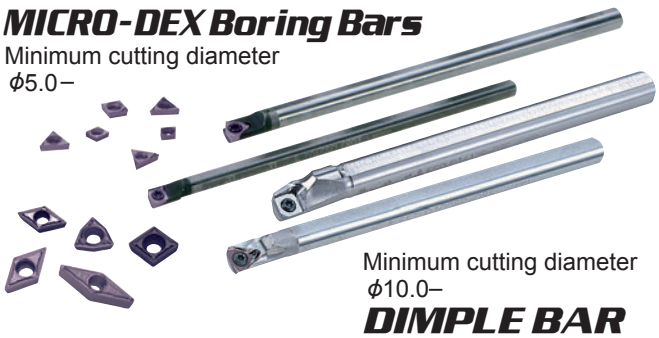
Boring
Grooving
Threading

Round Shank

Square Shank

MICRO-DEX Boring Bars

Minimum cutting diameter ϕ5.0–



Minimum cutting diameter ϕ10.0–

DIMPLE BAR

DRILLING TOOLS

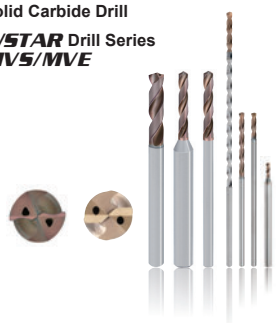
- Carbide drills
- HSS drills

Violet Coated Precision Drills

VAPDSSUS/VAPDMSUS
(For stainless steel)
VAPDSCB
(For counter boring)

Solid Carbide Drill

WSTAR **Drill Series**
MVS/MVE



END MILLING TOOLS

Solid Carbide End Mill

MSTAR **End Mill Series**

Vibration Control End Mills for Machining Diffi cult-to-Cut Materials

SMART MIRACLE **End Mill Series**

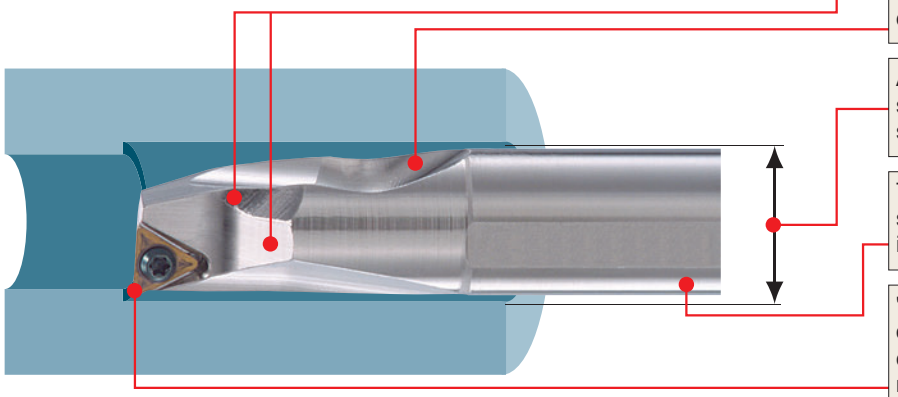
FEATURES OF DIMPLE BAR

Highly rigid steel shank and a lightweight head configuration designed by computer simulation analysis reduces chatter and improves the vibration damping properties.



- Chip disposal is improved by having two channels for chip evacuation.
- The lightweight head with its large dimple reduces chatter.
- Available in sizes smaller than the ISO standard. Therefore the boring of small diameter holes is possible.
- The boring bar has a laser printed scale on the shank to facilitate easy installation.
- "F and FS" breakers improves the quality of the surface finish, "MV" breaker offers excellent chip disposal. High wear resistant CBN inserts are also available for the machining of hardened materials.

VIBRATION RESISTANCE

●DIMPLE BAR

Weight of the Head	Damping Time
49.7g	15.8ms

By reducing the weight of the head, the damping properties are increased.

●Conventional Product

Weight of the Head	Damping Time
70.1g	20ms

* The simulation data stated above was conducted with a FSCLP1816R-09S holder, under the following conditions; l/d=5, depth of cut=0.5mm, and feed=0.05mm/rev.

Direction for the use of CCG/MT • CPG/MT • CPMX • TPG/MX type inserts

By changing the clamp screw, it is possible to use the inserts listed in the table below.

Holder : FSCLC/P • FSCLC/P...E

Insert Number	Clamp Screw
CCG/MT0602○○ (ϕ6.35)	Can be used as it is.
CPG/MT0802○○ (ϕ7.94)	Change to **TS3**
CPG/MT0903○○ (ϕ9.525)	Change to **TS4**
CPMX0802○○ (ϕ7.94)	Can be used as it is.
CPMX0903○○ (ϕ9.525)	Can be used as it is.

Holder : FSTUP • FSTUP...E

Insert Number	Clamp Screw
TPG/MX0802○○ (ϕ4.76)	Change to **CS200T**
TPG/MX0902○○ (ϕ5.56)	Change to **CS250T**
TPG/MX1103○○ (ϕ9.525)	Change to **CS300890T**

* If the screw is too long the please shorten as necessary.

(Note) TPMT/W09, W11 types cannot be used due to a different clamp screw size.

(Note) The MICRO-DEX and the MICRO-MINI cannot be fit to square holders.
*L24 is the length of overhang for sufficient clamping, and ( ) is the recommended length for machining of carbon and alloy steel.

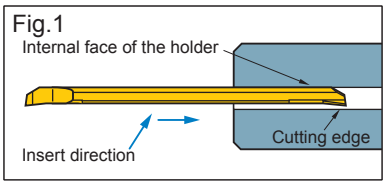
● : **Inventory maintained in Japan.**

PRECAUTIONS WHEN USING THE MICRO-MINI TWIN

●When using a holder for general purpose / small automatic lathe:

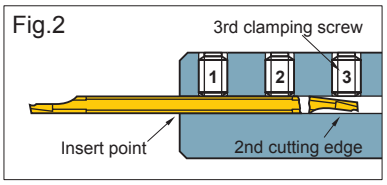
1 To avoid chipping of the 2nd cutting edge take care when inserting the boring bar into the holder. Refer to fig.1. If the 2nd edge contacts the internal face of the holder there is a possibility that it may chip.

Fig.1



2 When using this type of holder, there is a possibility that damage to the shank and the 2nd cutting edge can occur. Make sure that the clamping screws are tightened to the set torque value. Additionally make sure that there is no clamping screw near the 2nd cutting edge as this can break the boring bar.

Fig.2



◎When using Mitsubishi holders

When using holders with a tool overhang of recommended quantity, ensure that the 3rd clamping screw is removed prior to machining. (RBH1620N, RBH19020N, RBH2020N and RBH2520N do not have the 3rd screw.) The set torque value for clamping screw is 2.0 N•m.

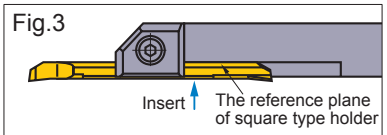
●When using a square type holder:

1 When installing the boring bar into the holder, tighten the clamp screws after ensuring the flats on the tool holder are parallel to the reference flats on the micro-mini bar. Refer to fig.3.

2 Make sure that the clamping screws are tightened to the recommended values.

3 Do not tighten the clamp screw without a bar in place, otherwise the bridge will be deformed.

Fig.3



Tighten the clamping screw ensuring making the micro-mini twin boring bars is in contact with the reference plane of square type holder.

MACHINING METHODS OF THE CR TYPE

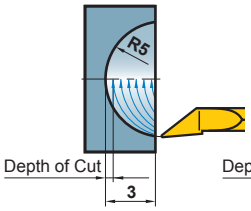
●Profile turning

By drilling a pre-prepared hole, the machining time will be shortened and chip control will be improved.

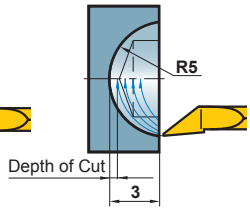
<Cutting Conditions>

Workpiece	: JIS S20C
Holder	: CR05RS-01B
Cutting Speed	: 80m/min
Feed	: 0.05mm/rev
Depth of Cut	: 0.05mm
Wet Cutting	

Machining a work piece without a pre-prepared hole



Machining a work piece with a pre-prepared hole



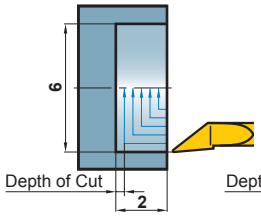
●Inner end facing

By drilling a pre-prepared hole, the machining time will be shortened and chip control will be improved.

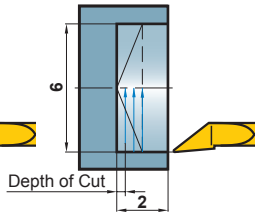
<Cutting Conditions>

Workpiece	: JIS S20C
Holder	: CR05RS-01B
Cutting Speed	: 80m/min
Feed	: 0.05mm/rev
Depth of Cut	: 0.05mm
Wet Cutting	

Machining a work piece without a pre-prepared hole

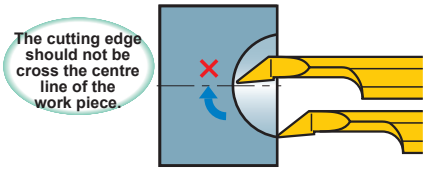


Machining a work piece with a pre-prepared hole



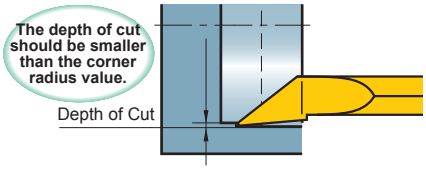
NOTES FOR USE

Profile turning, Inner end facing



If the cutting edge crosses the centre line of a work piece, the cutting edge can fracture.

Copying



With depths of cut larger than the corner radius value, burrs will be formed.

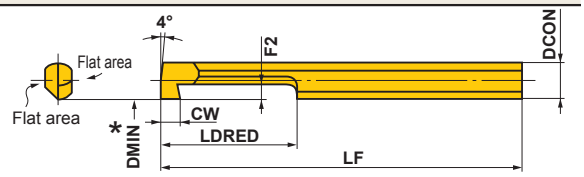
TECHNICAL INFO >> 1971

STANDARD MICRO-MINI BORING BARS (Solid carbide boring bar)

Order Number	Stock TF15	Dimensions(mm) CW	DCON	LF	LDRED	DMIN	F2	Geometry
C03FR-BLS	●	2.0	3	80	15	3.2	1.0	
C04FR-BLS	●	2.5	4	80	20	4.2	1.5	
C05HR-BLS	●	3.0	5	100	25	5.2	2.0	



Right hand tool only.

*DMIN : Min. Cutting Diameter

● : **Inventory maintained in Japan. (MICRO MINI is available in 1 piece in one pack.)**

RECOMMENDED CUTTING CONDITIONS

	Work Material	Cutting Speed (m/min)	Feed (mm/rev)	Depth of Cut (mm)	l/d	Edge Condition (mm) *Corner Radius or C	Edge Condition (mm) *Honing
P	Carbon Steel, Alloy Steel 180–350HB	40 (30–50)	0.05 (–0.1)	0.2 (0.1–0.3)	5	0.1–0.5	0.01–0.05
M	Stainless Steel ≤200HB	40 (30–50)	0.05 (–0.1)	0.2 (0.1–0.3)	5	≤0.4	≤0.03 (Honing not required)
K	Gray Cast Iron ≤350MPa	40 (30–50)	0.05 (–0.05)	0.2 (0.1–0.3)	5	0.1–0.5	0.01–0.05
N	Non-Ferrous Meterial	80 (60–100)	0.05 (–0.1)	0.3 (0.1–0.5)	5	0.1–0.5	≤0.03 (Honing not required)

*Cutting edge is not honed. Please hone according to the workpiece before machining.

GRINDING THE CUTTING EDGE OF MICRO-MINI BORING BAR

- MICRO-MINI boring bar can be applied to boring and grooving without any modifications. It can also be reground as shown below.
- For shaping and regrinding, use a diamond whetstone approximately #250–#400.
  Please grind according to the application using the figure below as a reference.

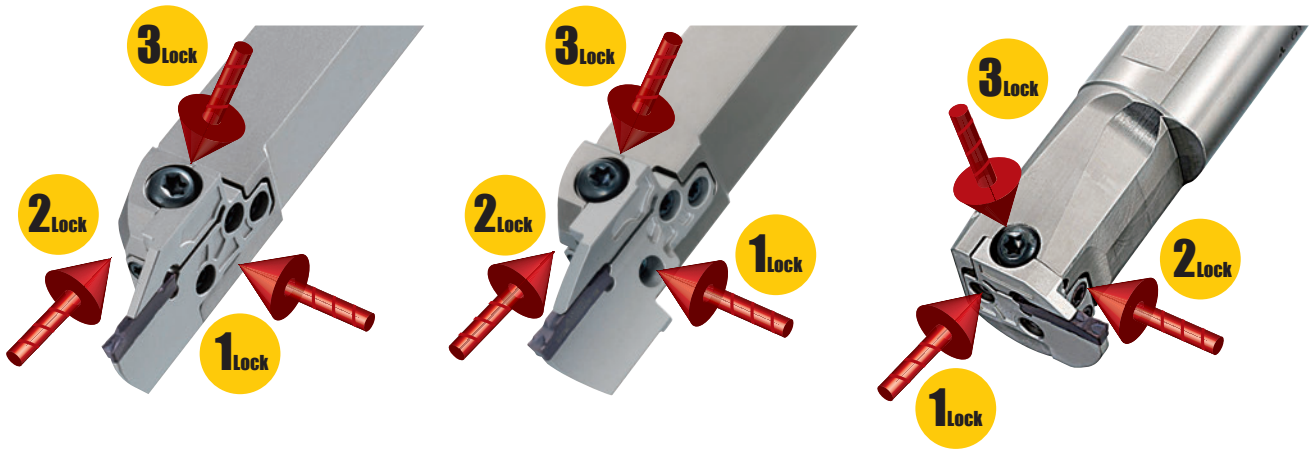
GY SERIES

GY series offers ultimate rigidity and accuracy for stable grooving.Easy to use modular blade system allows flexible tool management but maintains an overall strength comparable to a mono block type holder.

New Tri Lock System for increased stability and performance!

Innovative Tri Lock System

- Mitsubishi Materials has developed a new and unique, modular blade system.
  The Tri-Lock system ensures the blade is securely fixed in 3 directions (side, front and top) giving high rigidity for a stable grooving performance.

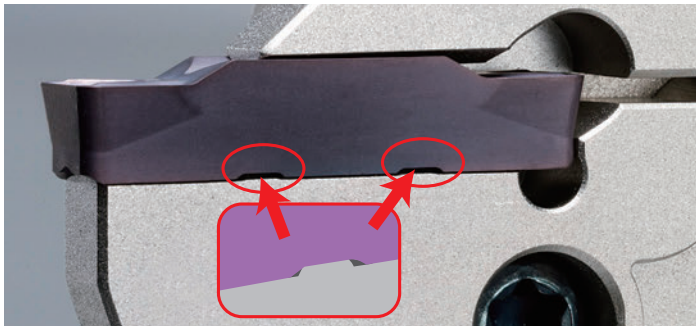


A wide variety of products with assorted combinations to consolidate necessary tools for diverse grooving applications.

Original insert design leading the way to new grooving applications !

Highly reliable insert clamping

- Safety keys prevent insert movement.



- The convex geometry ensures high precision clamping.

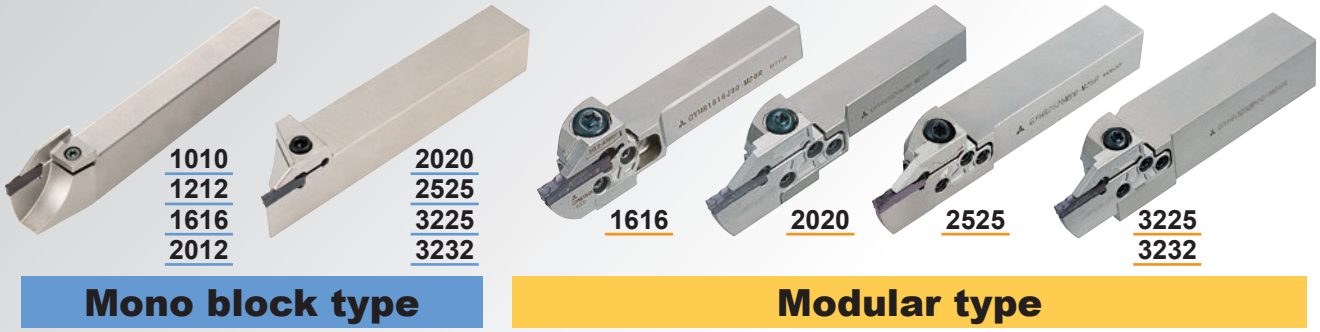
Blank Insert
(RT9010)
(RT9020)

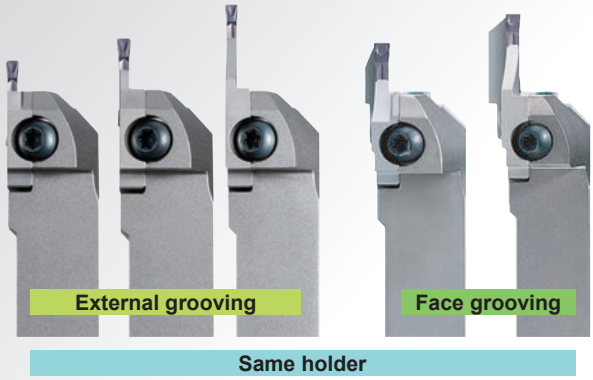
A wide selection of holders and inserts available for diverse grooving applications.

External • Face holders

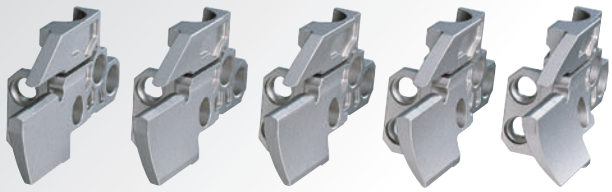
Corresponding blades to a variety of modular holders with different shank sizes.



A wide selection of holders and inserts available for diverse grooving applications



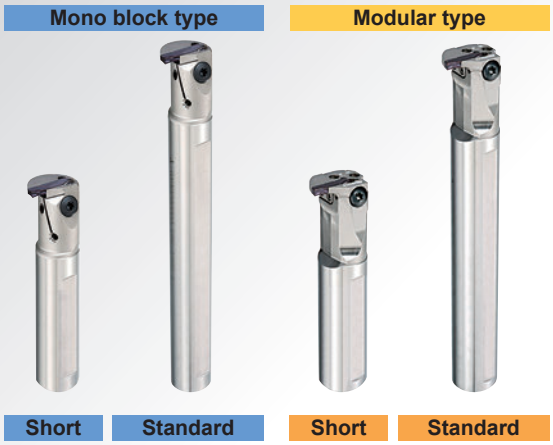
Applicable for various diameters of face grooves by the wide array of modular blades with different grooving diameters.



Internal holders

A wide range of holders available from minimum diameter of ø25mm.

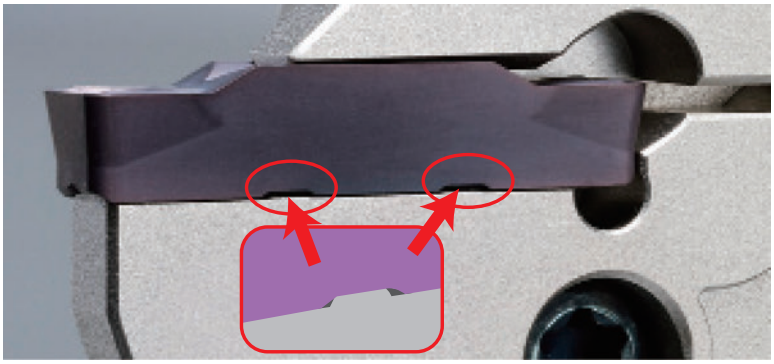
Short shank types are standard stocked.



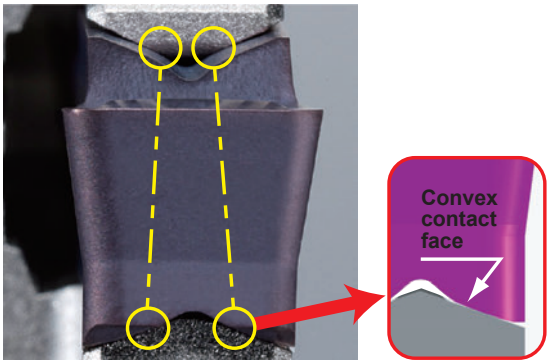
Original insert design leading the way to new grooving applications.

Highly reliable insert clamping

Safety keys prevent insert movement.

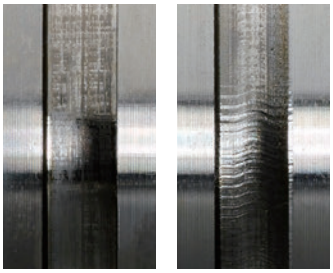


The convex geometry ensures high precision clamping.



Comparison of finished surface

GY series can achieve stable machining at the cutting conditions which created vibration with a conventional modular type tool.



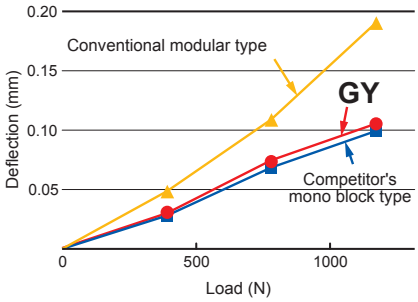
GY | Conventional modular type

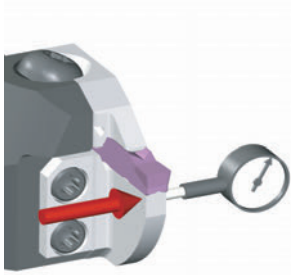
<Cutting Conditions>

Workpiece	: SCM440
Insert width	: 5mm
Cutting speed	: 150m/min
Feed	: 0.2mm/rev
Groove depth	: 23mm

Rigidity comparison

The GY series provides rigidity comparable to a mono block type grooving tool.





(Tool body for 5mm insert)

New TRI-LOCK System for increased stability and performance!

TRI-LOCK System

The TRI-LOCK system ensures the blade is securely fixed in 3 directions (side, front and top), giving high rigidity for stable grooving performance.

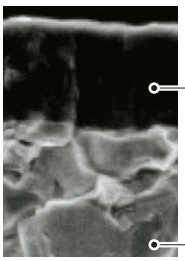
Machining Condition	VP10RT	VP10RT		RT9010	MB8025
			VP10RT		
	VP20RT	VP20RT	VP20RT	VP20RT	
Unstable					

Note1) VP20RT is the first recommended grade for materials other than hardened steel.
Note2) For VP10RT, VP20RT and MY5015, wet cutting is recommended.

VP20RT (1st Recommendation)

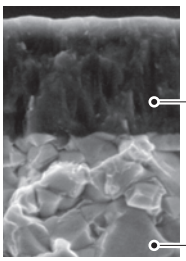


- PVD coated grade suitable for a wide range of applications. The combination of a special tough cemented carbide substrate with MIRACLE coating provides an excellent balance of wear and fracture resistance.

MIRACLE Coating

Tough cemented carbide substrate (HRA90.5)

VP10RT (2nd Recommendation)

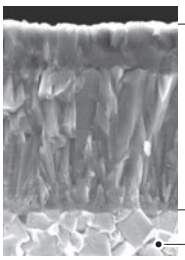


- PVD coated grade with a cemented carbide substrate harder than VP20RT. For use on difficult to cut materials and for extending tool life.

MIRACLE Coating

Tough cemented carbide substrate (HRA92.0)

MY5015



- MY5015 is a CVD coated grade with excellent wear resistance even at high temperatures. It provides longer tool life when machining cast and ductile cast irons. Also suitable for high speed continuous cutting of steels.

CVD Coated Carbide

Tough cemented carbide substrate

RT9010

- First recommended grade for Titanium alloys.
  Not recommended for use on non-ferrous alloys.

NX2525

- NX2525, a cermet grade for finish machining of steels and for good surface finishes at lower cutting speeds.

BC8110

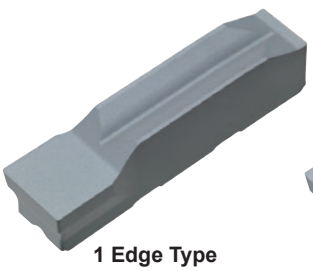
- A CBN coated grade for continuous cutting, which provides longer life when machining hardened steel.

MB8025

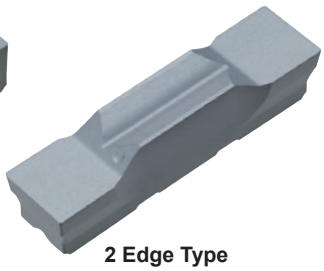
- MB8025 is a sintered CBN grade for hardened steel.

BLANK INSERTS

- Blank inserts for custom grinding



1 Edge Type



2 Edge Type

*** Insert blank is not suitable for machining without grinding.**
Refer to the following URL for more information.

RT9010/RT9020 for insert blank

- First recommendation on insert blank is RT9020 due to the tougher carbide substrate and suitable for a wide range of application.
  RT9010 is a harder substrate than RT9020 and is ideal for long tool life on stable cutting applications.
  Coating is recommended for application on steel, stainless steel and cast iron materials.

*1 The maximum groove depth varies according to the insert used.
*2 The maximum cut off diameter **CUTDIA** varies according to the insert used.
*3 Dimensions shown are when the gauge insert is used. If other insert geometries are used then **LF**, **LH** and **LH 2** values may vary.
*4 The maximum groove depth is limited by the workpiece diameter.

● : **Inventory maintained in Japan.**

RECOMMENDED CUTTING CONDITIONS [For External Grooving]

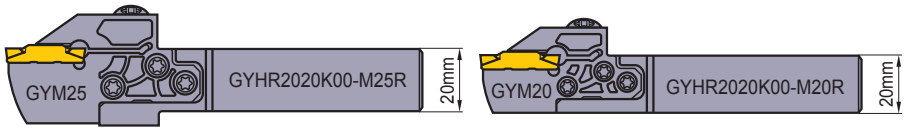
(Note) Lower the recommended cutting speed given in the table by 20% and 40% respectively when combining the following modular holders and modular blades.

● Decrease the feed rate by 20%.

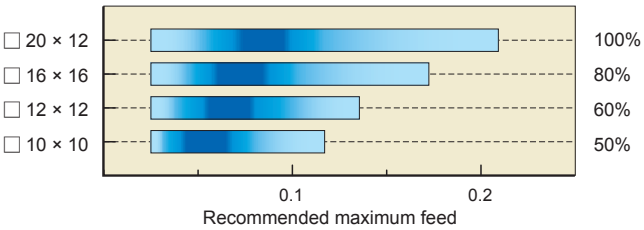


(20mm×20mm Square holder)

● Decrease the feed rate by 40%.

(16mm×16mm Square holder)

In the case of mono block type holder for Swiss style lathes

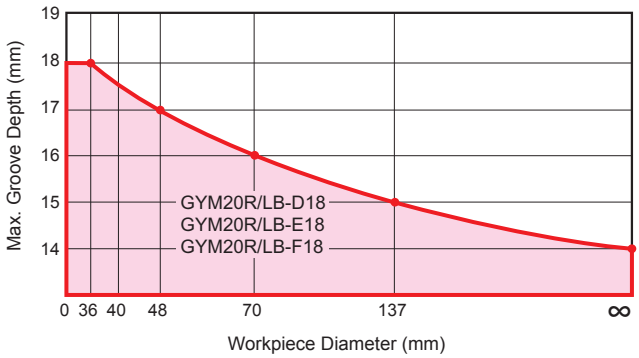


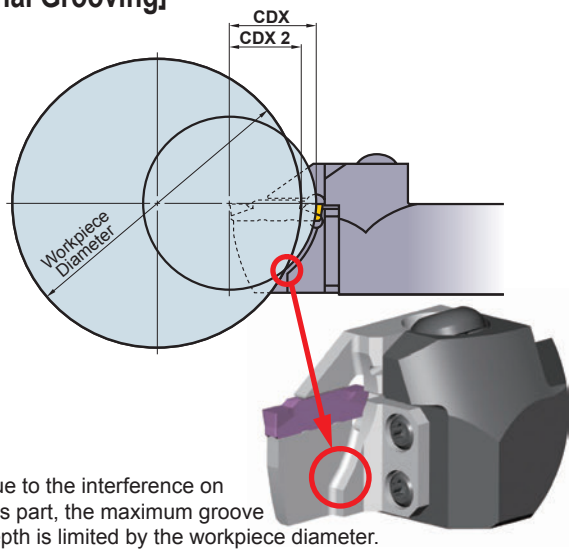
Please refer to the tables above on recommended cutting conditions for external grooving.
Apply the percentage ratio shown on each shank size with the values in the table.

LIMITATION OF THE MAXIMUM GROOVE DEPTH [For External Grooving]

•When using the modular blade GYM○○R/LA-○○○
The maximum groove depth is not limited by the workpiece diameter.

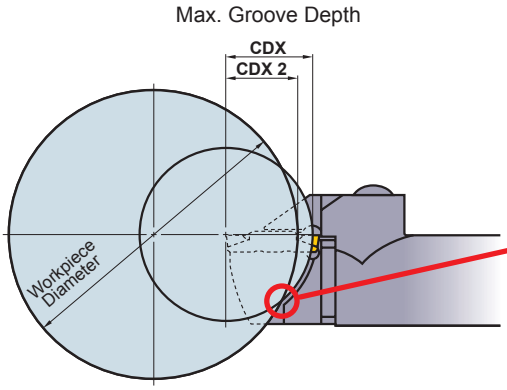
•When using the modular blade GYM○○R/LB-○○○
The maximum groove depth is limited by the workpiece diameter.



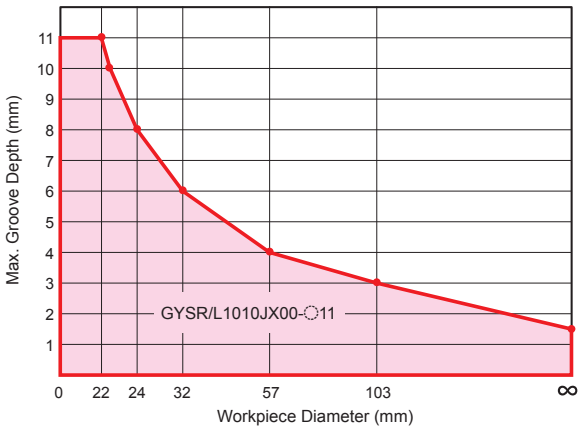


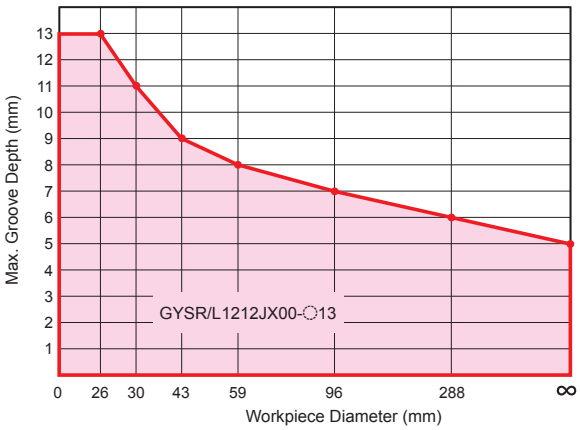
Due to the interference on this part, the maximum groove depth is limited by the workpiece diameter.

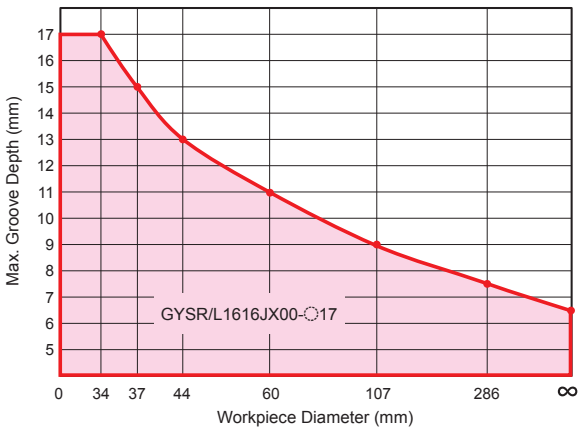
•In the case of mono block type holder for Swiss style lathes
The maximum groove depth is limited by the workpiece diameter.

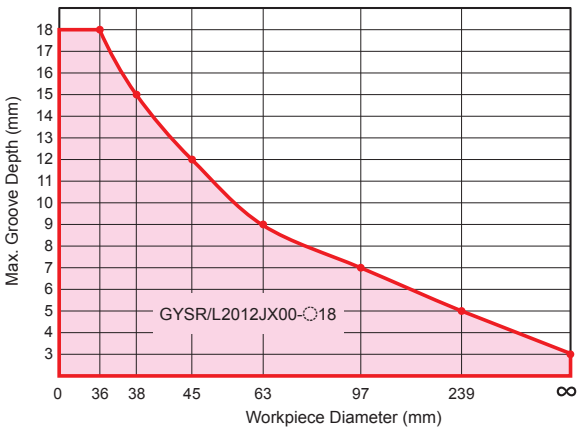


Due to interference, the maximum groove depth is limited by the workpiece diameter.









RECOMMENDED CUTTING SPEED (m/min) [For External Recessing]

	Work Material	Hardness	Grade	Cutting Speed (m/min) 50–250
P	Mild Steel	≤180HB	VP20RT	80–180
			VP10RT	90–190
	Carbon Steel, Alloy Steel	180–280HB	VP20RT	60–140

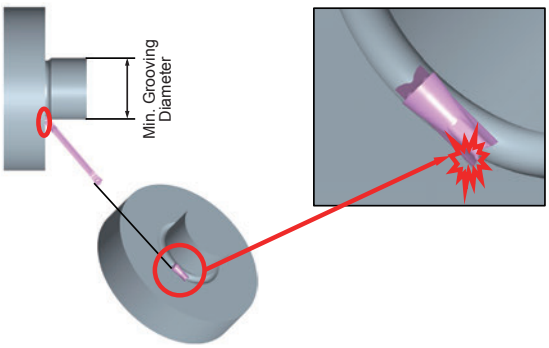
6.00	3.50	1.232
6.35	3.68	1.283

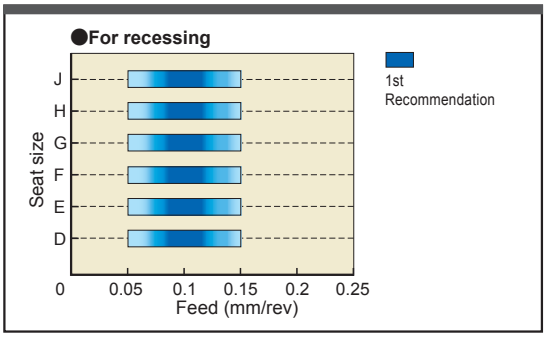
BM BREAKER

Minimum grooving diameter

Ensure the tool is suitable for the diameter being machined. Refer to the Min. Grooving Diameter D1 as shown in the table on the "page number" to avoid a collision with the workpiece shown below.



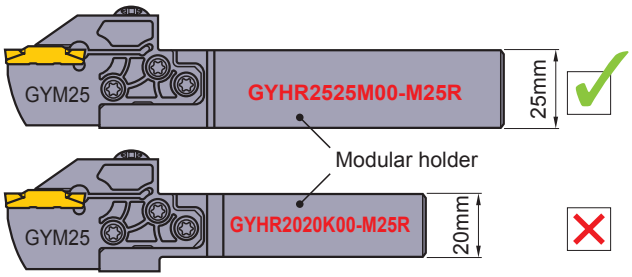
Recommended feed rate and depth of cut



TOOL SELECTION

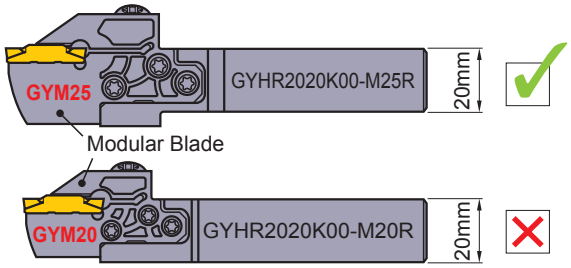
Notes when selecting the tool body

Precautions when selecting a modular holder.



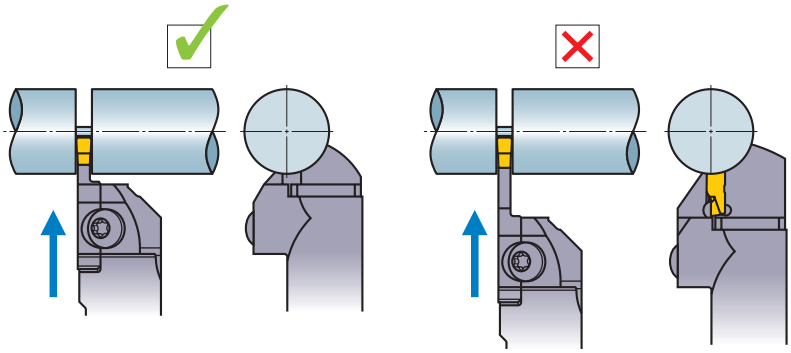
●Select a modular holder with the largest possible shank size to maintain mounting rigidity.

Modular blade (1)



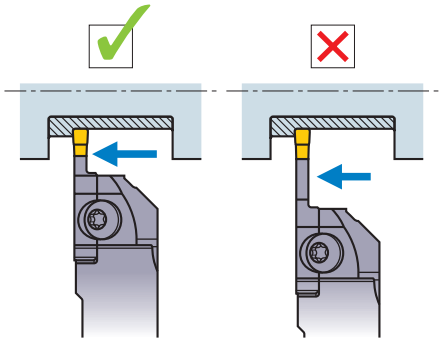
●If there is no restriction for use, select the largest modular blade for the same shank size.

Modular blade (2)



●Select the shortest possible blade suitable for the application.

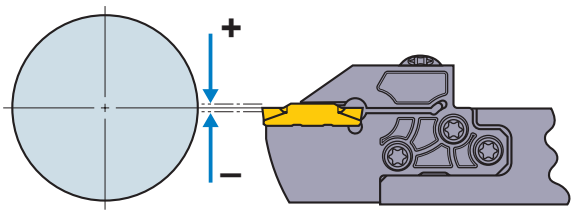
Modular blade (3)



●Select the shortest possible blade suitable for the application.

Notes when setting the tool

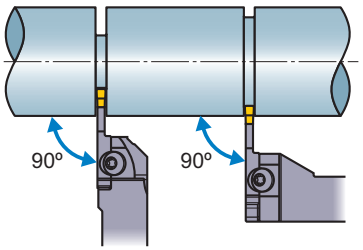
Setting of cutting edge height



<Grooving/Cross-feed machining>
Set the cutting edge height to ±0.1mm parallel to the central axis.

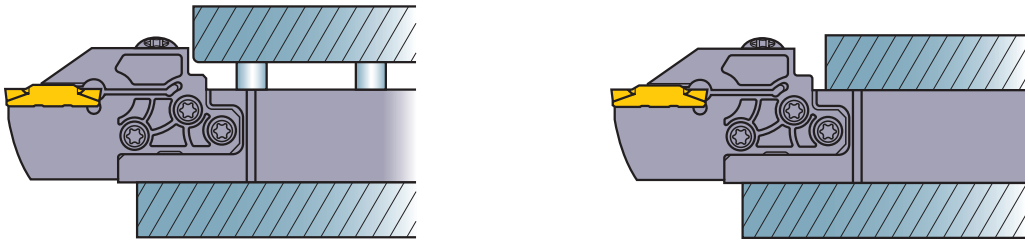
<Cutting off>
Set the cutting edge height to 0–+0.2mm parallel to the central axis.

Tool body setting angle



●Set the insert perpendicular to the central axis.

Overhang

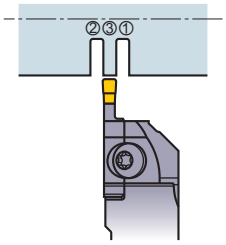


●When setting the tool, ensure that the overhang is as short as possible and avoid the step difference part as above figure shows.

MACHINING RECOMMENDATIONS

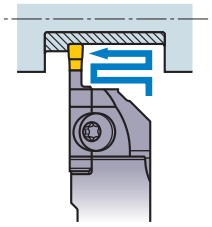
Notes on multi-functional machining (MF,MS,MM and BM breakers)

Machining narrow grooves



●It is recommended to carry out plunging in several passes. Following the steps above makes it difficult for chips to elongate. This also improves the accuracy of workpiece wall surface.

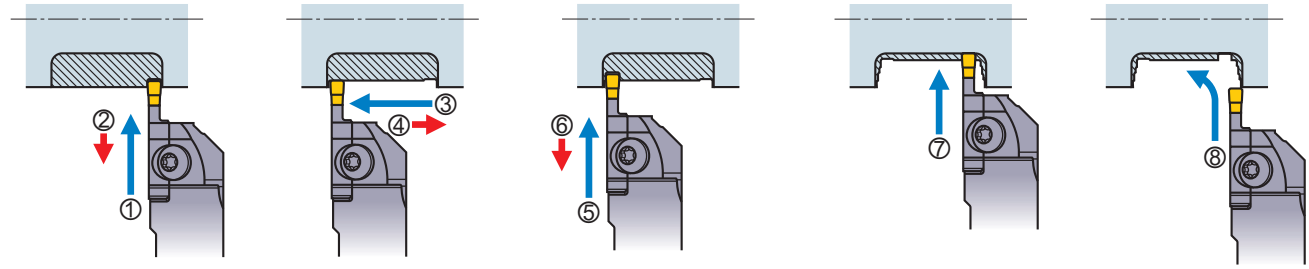
Machining wide grooves



●It is recommended that cross-feed machining is used.

Machining wide grooves

ROUGHING → FINISHING



①Carry out grooving.
②Retract the tool approx 0.1mm.

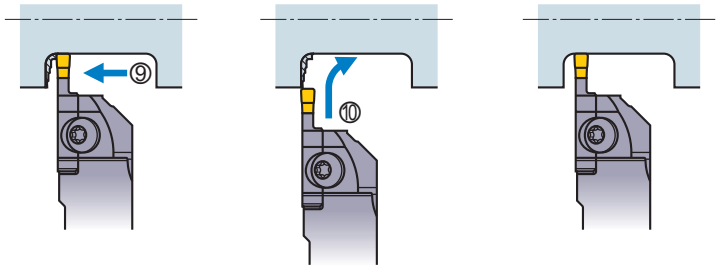
③Carry out cross feed machining.
④Retract the tool approx 0.1mm.

⑤Carry out grooving.
⑥Retract the tool approx 0.1mm.
* Repeat the steps ①–⑥.

⑦Carry out grooving to the end point of the corner radius.

⑧Machining of the wall surface, corner radius and bottom face should be carried out in one process.

FINISHING

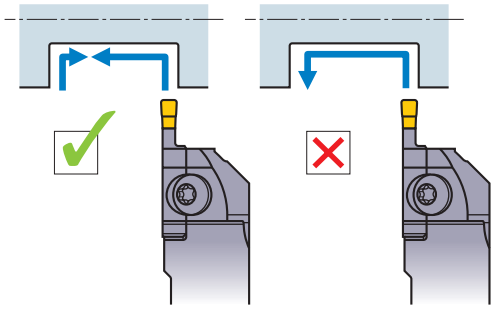


⑨Stop at the bottom of the corner radius.

⑩Machine the counter wall to the corner radius in one process.

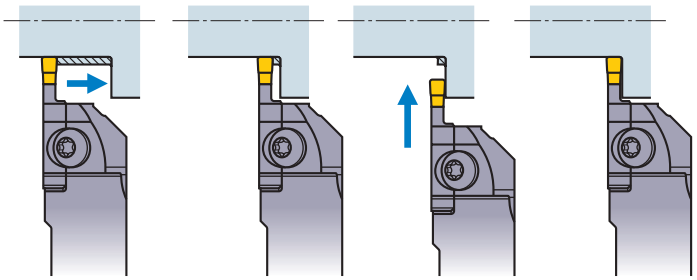
⑪Finish machining.

Precautions when finishing walls



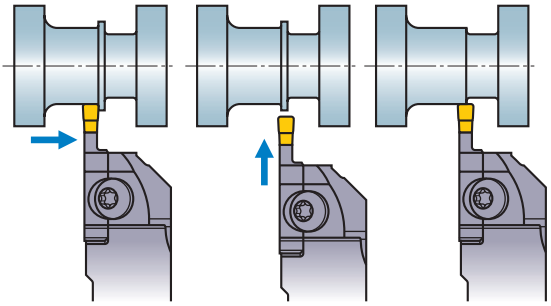
●To produce high accuracy walls using MS or MM breaker insert, do not carry out back turning. Plunging is recommended.

Wall machining



●When machining a wall, chip jamming can occur. In this case, stop cross feed machining just before the wall (at a point less than the insert width) then remove the remaining material by plunging.

Machining of a ring section

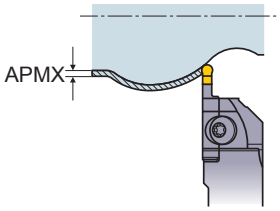


●When a ring remains in a cross feed end process, finish cross feed machining 1–1.5mm short of the end point, then remove the ring by plunging.

MACHINING RECOMMENDATIONS

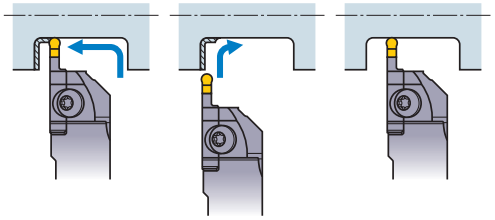
Notes on multi-functional machining (BM breaker)

Copying



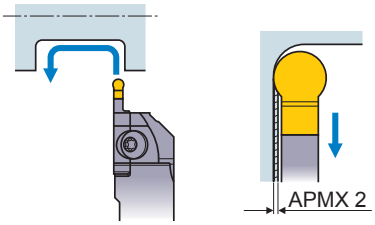
●With the BM breaker insert, 3 dimensional copying is possible.
Set the depth of cut (APMX) to 40% less than the insert width.

Roughing



●Use plunging and cross-feed machining.
When machining the corner, vibration is likely to occur.
To avoid this, reduce the feed by 50%.

Finishing



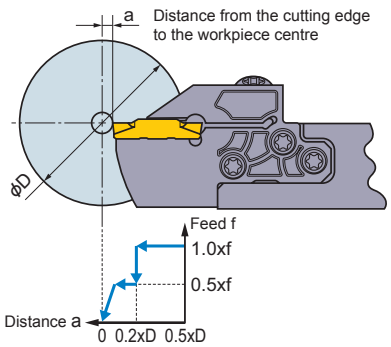
Insert	APMX 2 (mm)
GY2M0200D100N-BM	0.05
GY2M0250E125N-BM	0.10
GY2M0300F150N-BM	0.15
GY2M0318F159N-BM	
GY2M0400G200N-BM	0.20
GY2M0475H238N-BM	0.24
GY2M0500H250N-BM	
GY2M0600J300N-BM	0.30
GY2M0635J318N-BM	
GY2M0800K400N-BM	0.40

●Carry out finishing in one process.
For the depth of cut (APMX 2) when back turning, refer to the table on the right.

Notes for cutting off

Feed

<Feed>

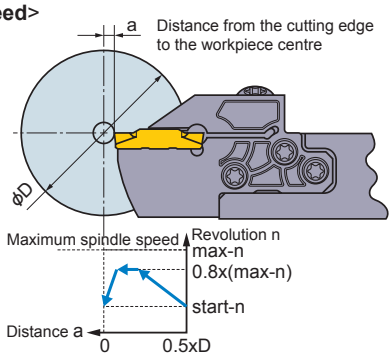


●When the cutting edge approaches the centre, reduce the feed by 50%.

●If necessary, stop the feed prior to reaching the centre of the workpiece to prevent it falling under its own weight.

Revolution

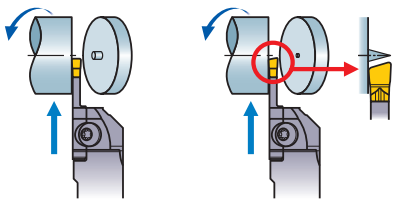
<Spindle speed>



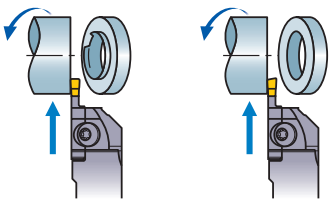
●When using constant cutting speed during a cutting off cycle, it is recommended to limit the spindle speed to 80% of maximum to ensure stability.

●To prevent the workpiece from being expelled, lower the spindle speed before finishing the grooving operation.

Insert



Neutral insert　　Handed insert



Neutral insert　　Handed insert

●When there is a centre stub on solid bar work or burrs are formed on pipe material, it is possible to decrease them by using a handed insert.
With a handed insert, machining tends to be less stable when compared to using a neutral insert.
Pay special attention to avoid fracturing of the cutting edge and decrease the feed when necessary.

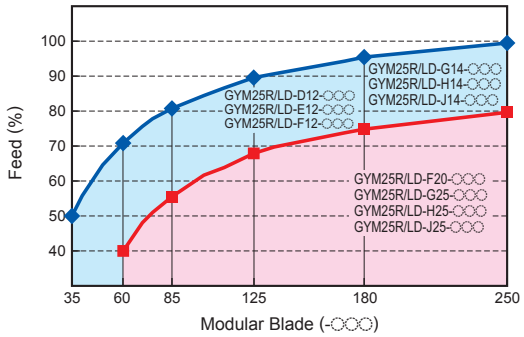
RELATIONSHIP BETWEEN THE MODULAR BLADE AND FEED PER ROTATION [For Face Grooving]



(Note) Adjust the feed per rotation in the cutting conditions to the percentage shown in the table above.

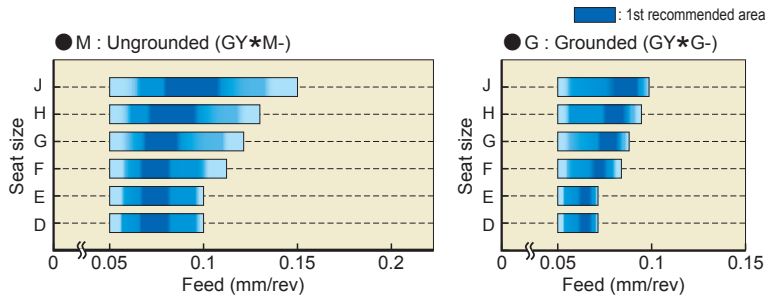
RECOMMENDED CUTTING SPEED (m/min) [For Face Grooving]

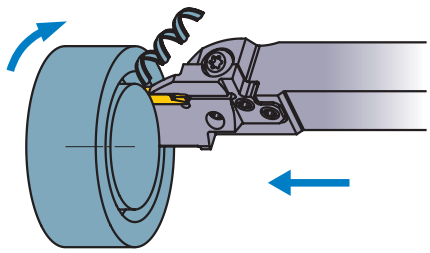
	Work Material	Hardness	Grade	Cutting Speed (m/min)
P	Mild Steel	≤160HB	VP20RT	80–180
			VP10RT	90–190
			NX2525	70–170
	Carbon Steel Alloy Steel	160–280HB	VP20RT	60–140
			VP10RT	70–150
			MY5015	90–210
			NX2525	55–135
		280HB≤	VP20RT	50–110
			VP10RT	60–120
			MY5015	80–160
			NX2525	45–105
M	Stainless Steel	≤270HB	VP20RT	50–110
			VP10RT	60–120
K	Gray Cast Iron	Tensile Strength ≤300MPa	VP20RT	60–140
			VP10RT	70–150
			MY5015	90–210
	Ductile Cast Iron	Tensile Strength ≤800MPa	VP20RT	50–110
			VP10RT	60–120
			MY5015	80–160
S	Heat Resistant Alloy Titanium Alloy	–	VP20RT	30–60
			VP10RT	40–70
			RT9010	40–70
H	Hardened steel	50HRC≤	BC8110	60–100
			MB8025	60–100

(Note 1) VP20RT is the first recommended grade for materials other than hardened steel.
(Note 2) For VP10RT, VP20RT and MY5015, wet cutting is recommended.

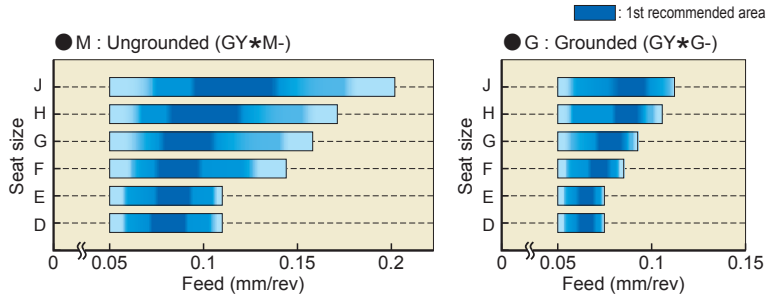
RECOMMENDED CUTTING CONDITIONS [For Face Grooving]

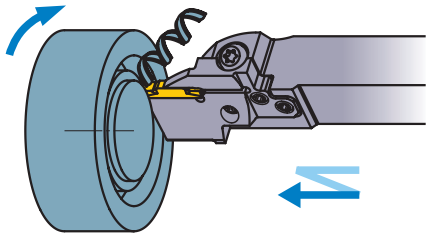
GROOVING





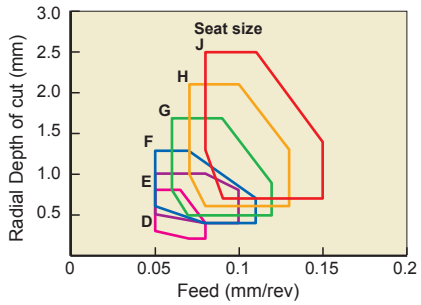
PLUNGING





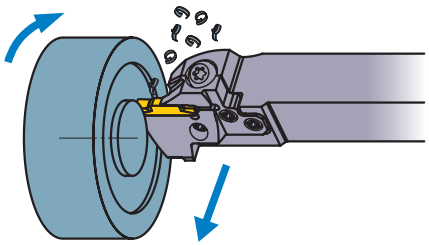
* After the 1st plunge, the width of cut should be set narrower than insert with CW.

TRAVERSE MACHINING (MF BREAKER)

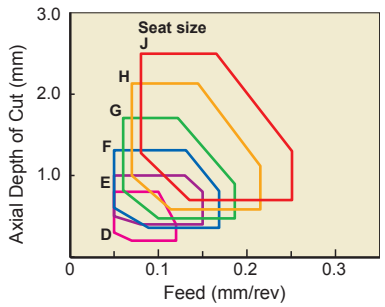


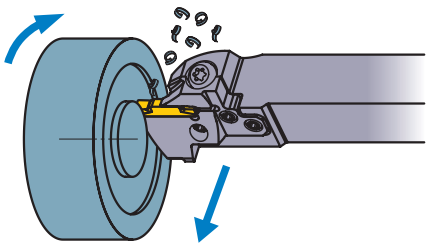
Seat Size	Insert Width (mm)
D	2.00 2.24
E	2.39 2.50 2.74
F	3.00 3.18 3.24

Seat Size	Insert Width (mm)
G	4.00 4.24
H	4.75 5.00 5.24
J	6.00 6.31 6.35

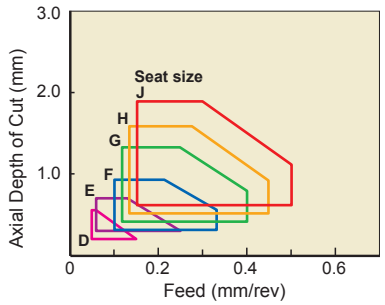


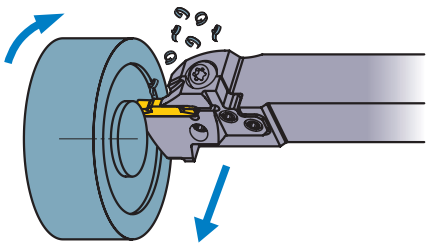
TRAVERSE MACHINING (MM/MS BREAKER)





TRAVERSE MACHINING (BM BREAKER)

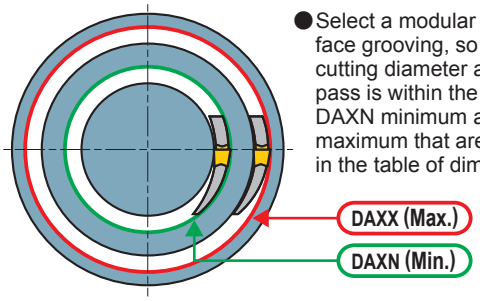




TOOL SELECTION

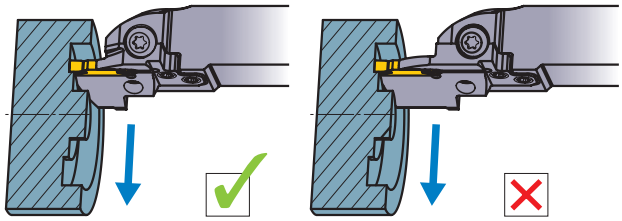
Notes when selecting the tool body

Modular blade (1)



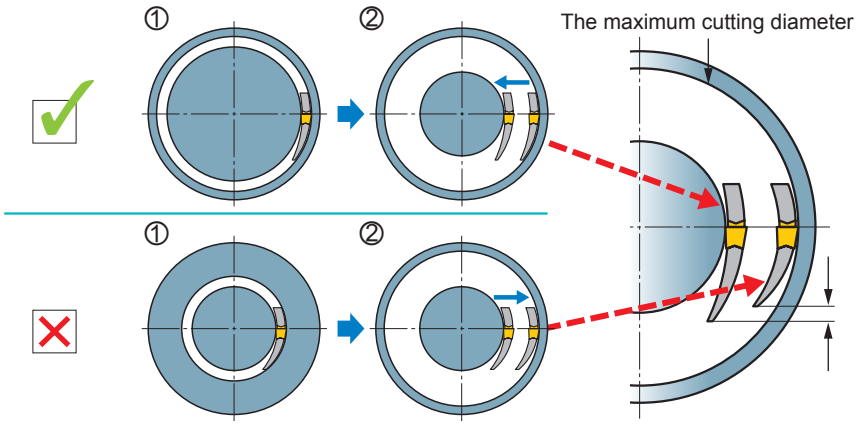
- Select a modular blade for face grooving, so that the cutting diameter at the first pass is within the range of DAXN minimum and DAXX maximum that are described in the table of dimensions.

Modular blade (2)



- Select the shortest possible blade suitable for the application.

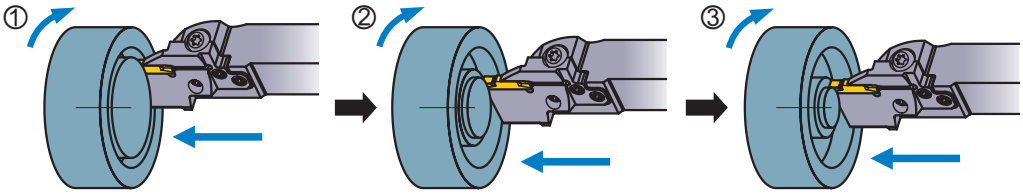
Modular blade (3)



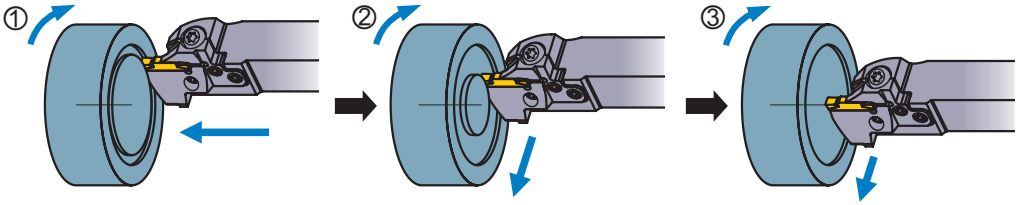
- Select the largest size blade within the maximum cutting diameter of the workpiece.
- Machine from the outer diameter towards the centre.
- Increased machining stability and rigidity is possible if a modular blade with the largest possible back metal is used.

- At first machine the maximum cutting diameter, there is no restriction in the cutting diameter on the remaining process.

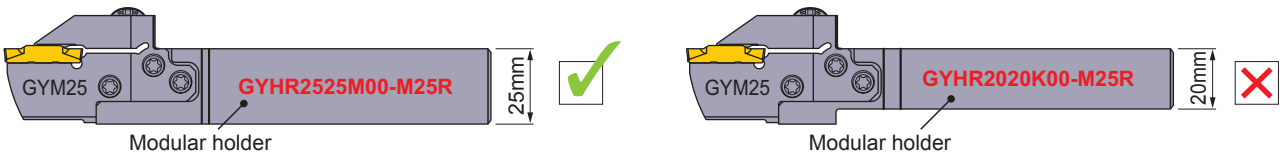
- When plunging in several passes.



- When combining plunging and infeed machining.



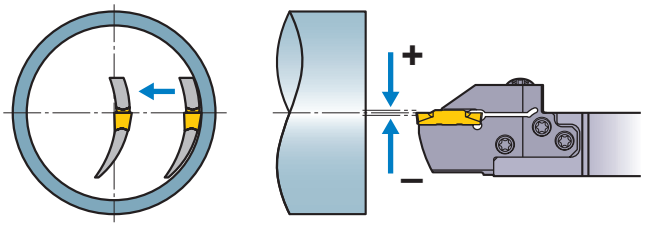
Precautions when selecting a modular holder.



- Select a modular holder with the largest possible shank size to maintain mounting rigidity.

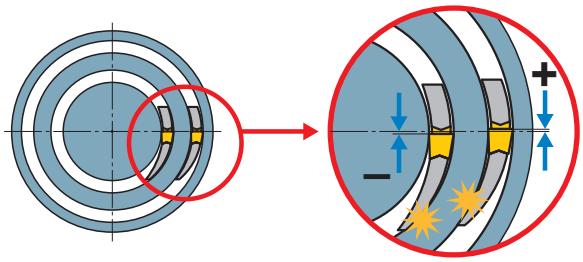
Notes when setting the tool

Setting the cutting edge height



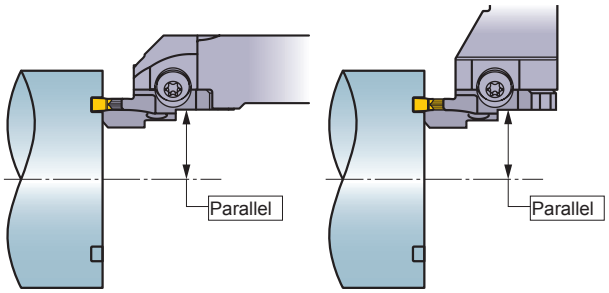
●Set the cutting edge height to ±0.1mm parallel to the central axis.
●Cutting edge centre height check should be done by traverse machining towards the centre with a very small depth of cut and ensure that an even surface and no material remains at the centre point afterwards.

When intertering the wall of groove and the Modular blade



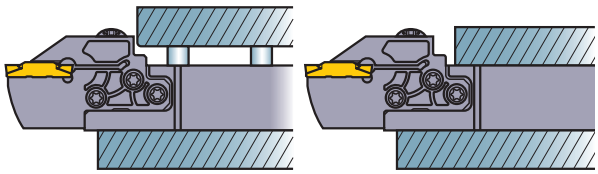
●If interference occurs even when the correct blade is used, the cutting edge height could be incorrect.
When interference occurs on the inner side of the blade, the cutting edge height is set too high.
When interference occurs on the outer side of the blade, the cutting edge height is set too low.

Setting the tool



●Set the insert parallel to the central axis.

Tool overhang



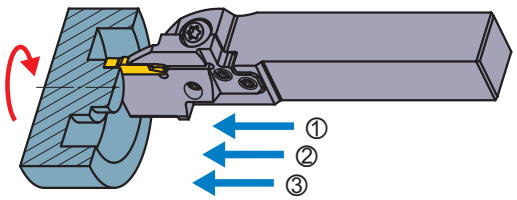
●When setting the tool, ensure that the overhang is as short as possible and avoid the step difference part as above figure shows.

MACHINING RECOMMENDATIONS

Notes when face grooving

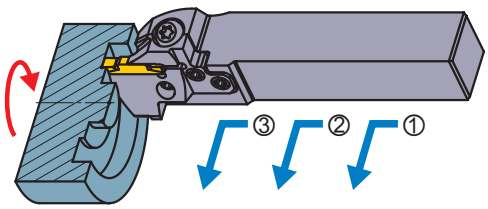
●**Always machine from the outer diameter towards the centre.**

Machining narrow grooves



●Plunging in several passes is recommended.

Machining wide grooves

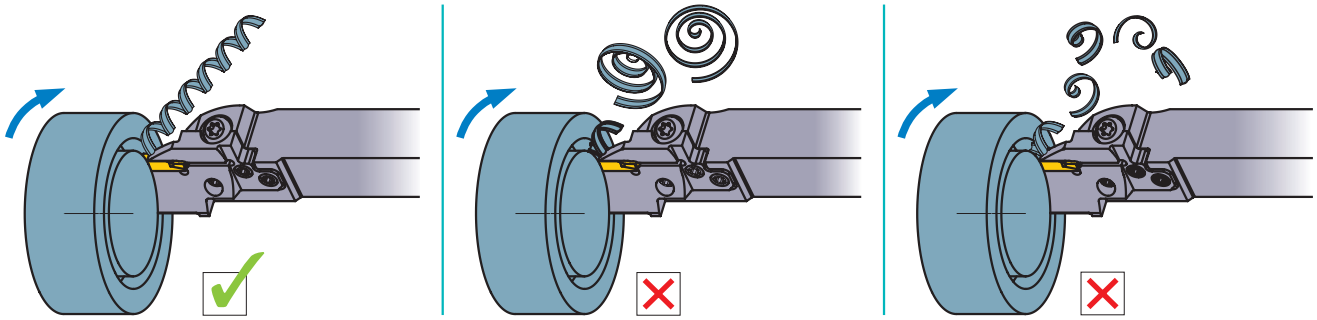


●Cross feed machining is recommended.

MACHINING RECOMMENDATIONS

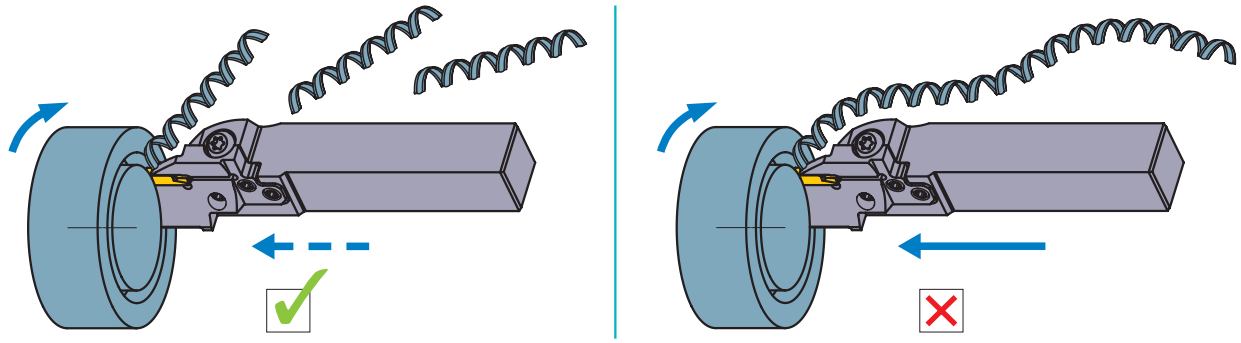
Notes when face grooving (2)

Notes on the first pass (1)



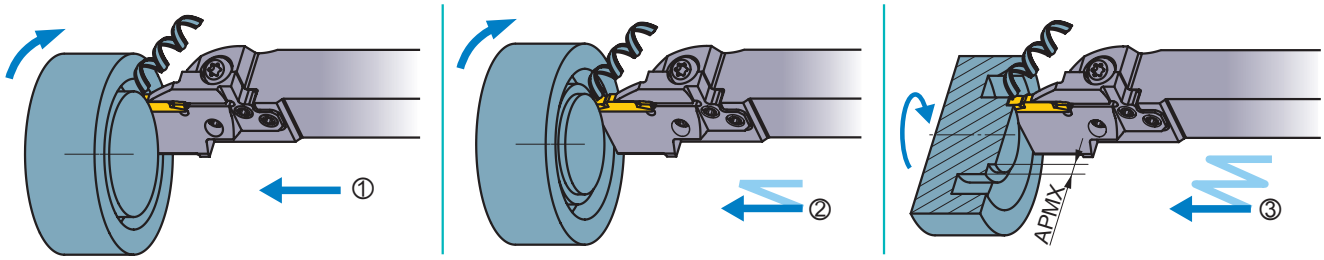
●During the first face grooving pass it is difficult to disperse broken chips and can lead to problems such as a chipped insert. Maintain longer chips that disperse easily by decreasing the feed per rotation.

Notes on the first pass (2)



●When chips become too long, use peck feed to break them into a suitable length.

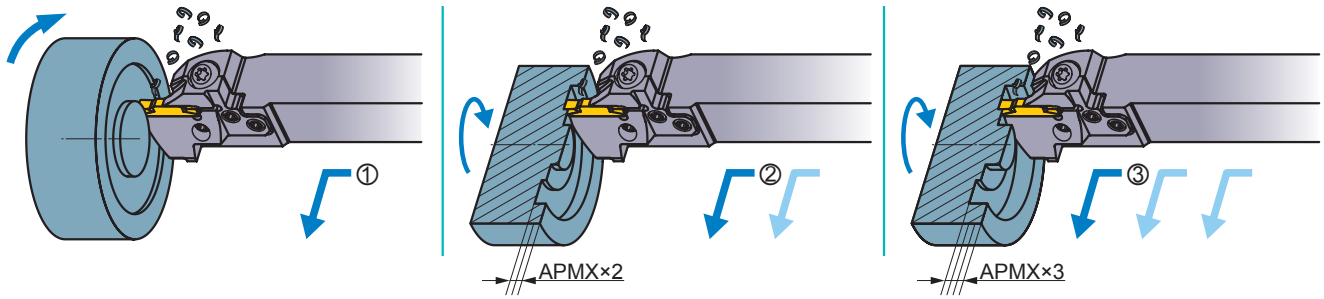
Notes when wide face grooving by plunging in several passes



●When machining a face groove in several passes, machine from the outer diameter towards the centre so that space for discharging chips is created to prevent insert damage caused by chip jamming.

●Plunging width of cut is recommended to be set at 60 - 80% of the insert width. This enhances the effect of the chipbreaker by enlarging the width of the groove to improve chip dispersal.

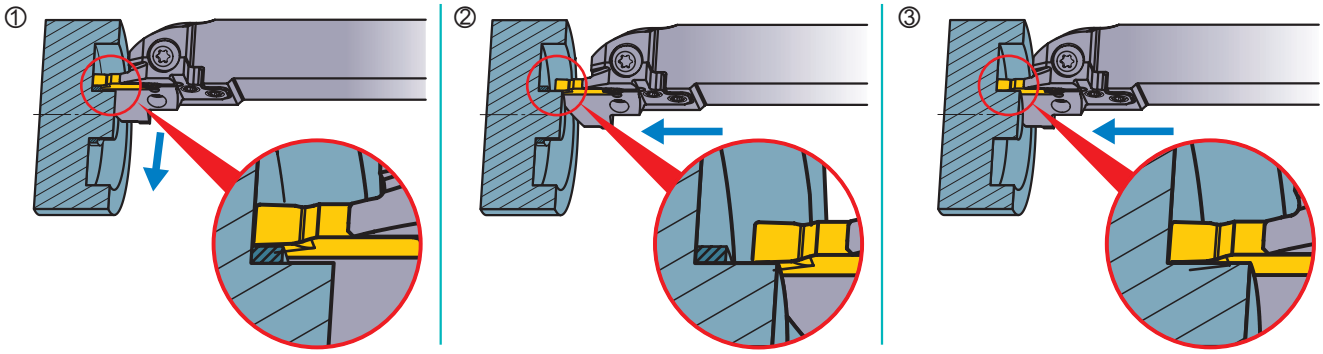
Notes when wide face grooving by combination of plunging and traverse machining (1)



●When face groove machining by using plunge feed and traverse machining, always machine from the outer diameter towards the centre to disperse chips outward to avoid chip jamming problems.

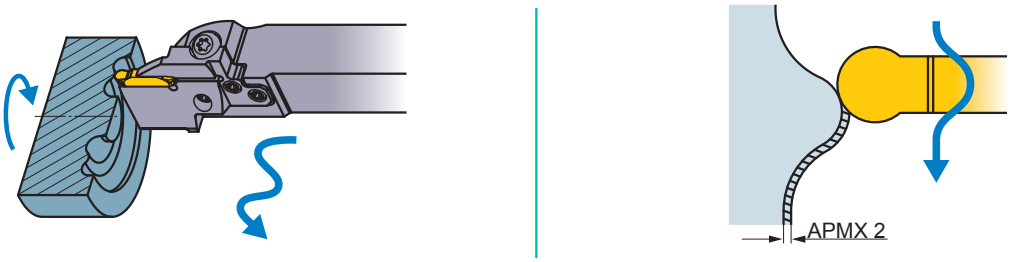
●Set the depth of cut within 40% of the insert width.

Notes when wide face grooving by combination of plunging and traverse machining (2)



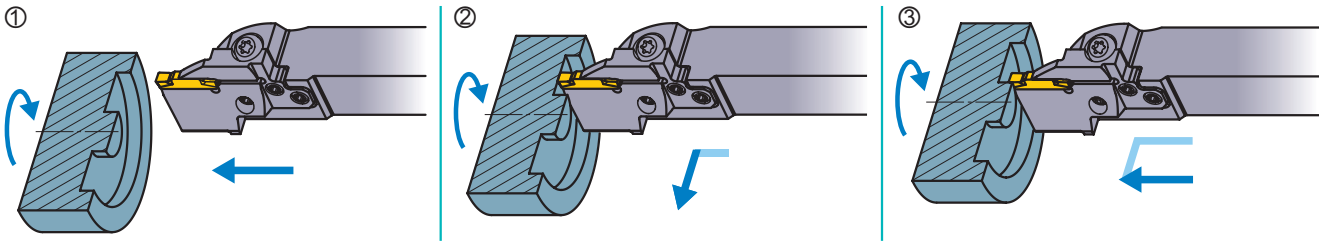
●When infeed machining at the bottom of a deep groove, chips may interfere on the cutting edge near the centre wall.
In such cases, stop infeed machining just before the centre wall (at a point less than the insert width) then remove the remaining material by plunging.

Notes when copying (BM Breaker)



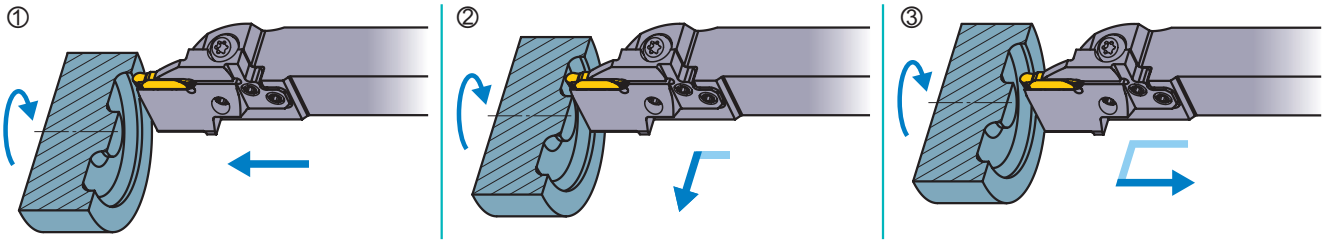
●With the BM breaker insert, 3 dimensional copying is possible. Set the depth of cut (APMX 2) to 30% less than the insert width.

Finishing (1)



●When finish cutting, machine continuously from the outer wall to the bottom of the groove, then finally plunge cut the centre wall.

Finishing (2) (BM Breaker)



●Carry out finishing in one process.
For the depth of cut (APMX 2) when back turning, refer to the table on the right.

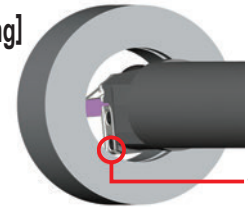
RECOMMENDED CUTTING SPEED (m/min) [For Internal Grooving]

	Work Material	Hardness	Grade	Cutting Speed (m/min) 50–300
P	Mild Steel	≤160HB	VP20RT	80–180
			VP10RT	90–190
			NX2525	70–170
	Carbon Steel Alloy Steel	160–280HB	VP20RT	60–140
			VP10RT	70–150
			MY5015	90–210
			NX2525	55–135
		280HB≤	VP20RT	50–110
			VP10RT	60–120
			MY5015	80–160
			NX2525	45–105
M	Stainless Steel	≤270HB	VP20RT	50–110
			VP10RT	60–120
K	Gray Cast Iron	Tensile Strength ≤300MPa	VP20RT	60–140
			VP10RT	70–150
			MY5015	90–210
	Ductile Cast Iron	Tensile Strength ≤800MPa	VP20RT	50–110
			VP10RT	60–120
			MY5015	80–160
S	Heat Resistant Alloy Titanium Alloy	–	VP20RT	30–60
			VP10RT	40–70
			RT9010	40–70
H	Hardened steel	50HRC≤	BC8110	60–100
			MB8025	60–100

(Note 1) VP20RT is the first recommended grade for materials other than hardened steel.
(Note 2) For VP10RT, VP20RT and MY5015, wet cutting is recommended.

LIMITATION OF THE MAXIMUM GROOVE DEPTH [For Internal Grooving]



Due to interference of this part, the maximum groove depth is limited by the cutting diameter.

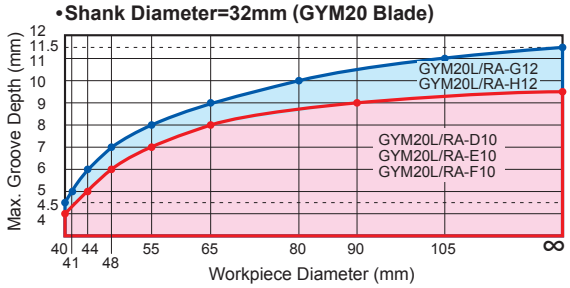
•When using the mono block type

The maximum groove depth is not limited by the cutting diameter.

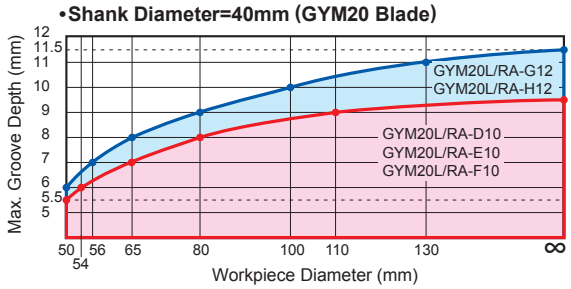
•When using the modular blade type

The maximum groove depth is limited by the cutting diameter.

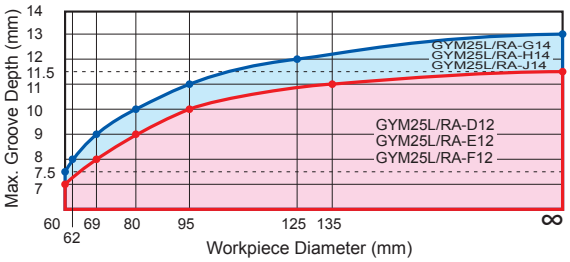
•Shank Diameter=32mm (GYM20 Blade)



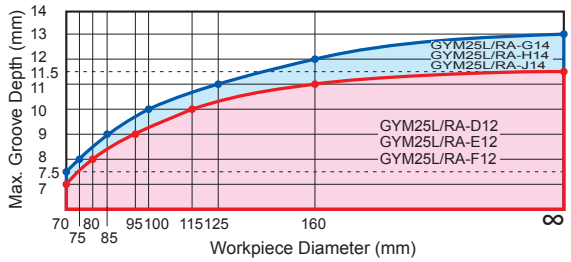
•Shank Diameter=40mm (GYM20 Blade)



•Shank Diameter=40mm (GYM25 Blade)

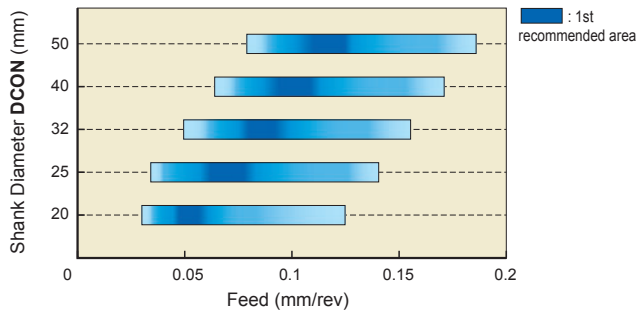


•Shank Diameter=50mm (GYM25 Blade)

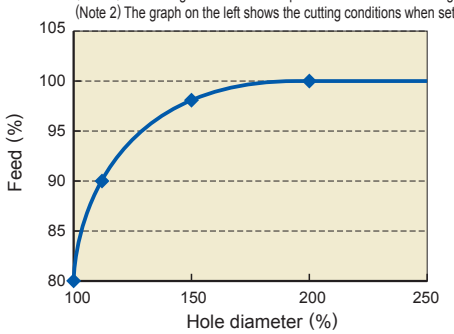


RECOMMENDED CUTTING CONDITIONS [For Internal Grooving]

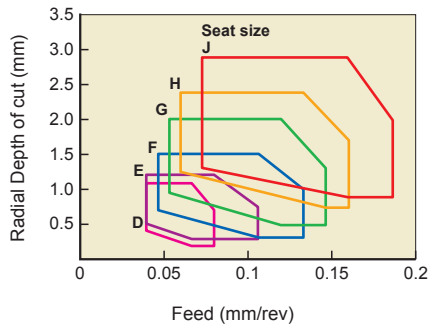
GROOVING



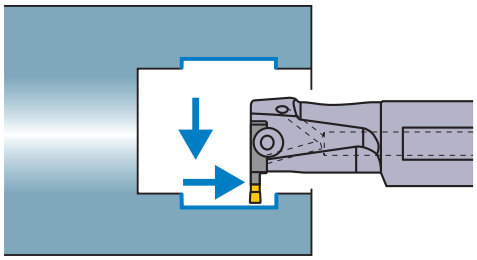
(Note 1) The cutting diameter 100% represents the minimum cutting diameter (DMIN).
(Note 2) The graph on the left shows the cutting conditions when setting the feed to 100%.



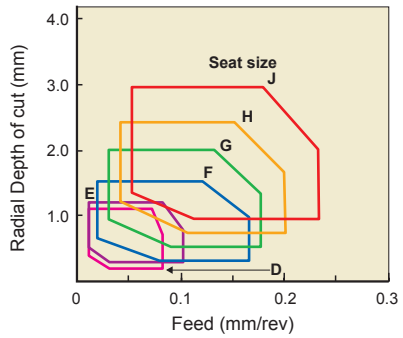
TRAVERSE MACHINING (MF BREAKER)



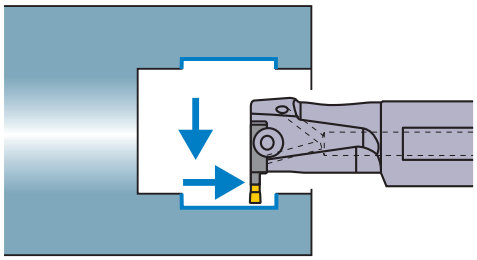
●When traverse machining a blind hole, it is recommended to carry out back turning considering chip disposal.



TRAVERSE MACHINING (MM/MS BREAKER)

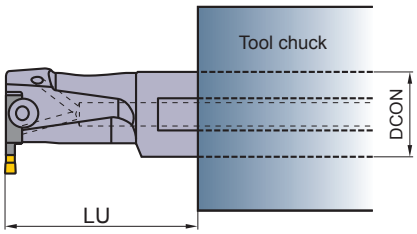


●When traverse machining a blind hole, it is recommended to carry out back turning considering chip disposal.



(Note) The above cutting conditions are for when using the tool overhang (LU) 1.6-2.0 times larger than the shank diameter (DCON). (L/D=1.6-2.0)
When using L/D larger than 2.0, reduce the cutting conditions.

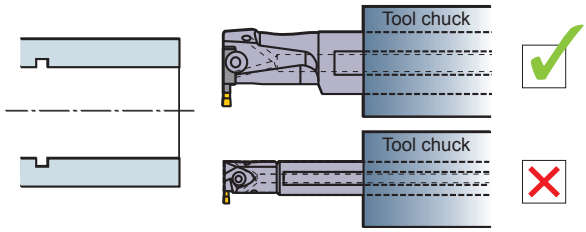
	Seat Size Insert Width (mm)
D	2.00 2.24
E	2.39 2.50 2.74
F	3.00 3.18 3.24
G	4.00 4.24
H	4.75 5.00 5.24
J	6.00 6.31 6.35



TOOL SELECTION

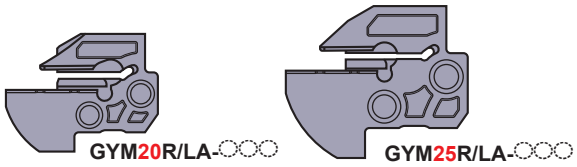
Notes when selecting the tool body

Holder



●When the overhang is the same, select a holder with the largest possible shank size to ensure sufficient clamping rigidity.

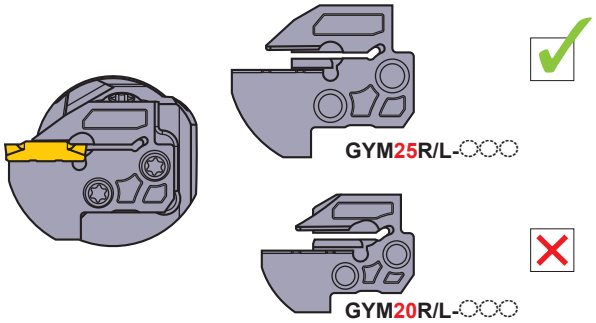
Modular blade (1)



GYM20R/LA-D10	GYM25R/LA-D12
GYM20R/LA-E10	GYM25R/LA-E12
GYM20R/LA-F10	GYM25R/LA-F12
GYM20R/LA-G12	GYM25R/LA-G14
GYM20R/LA-H12	GYM25R/LA-H14
	GYM25R/LA-J14

●For a ø40 shank holder, if there is no restriction for use, select a holder suitable for GYM25 blade.

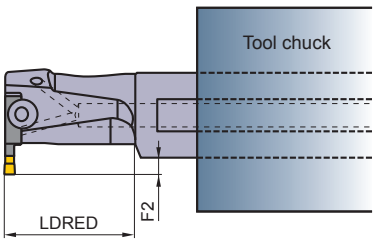
Modular blade (2)



●For an internal holder, select a modular blade listed above.

Notes when setting the tool

Overhang



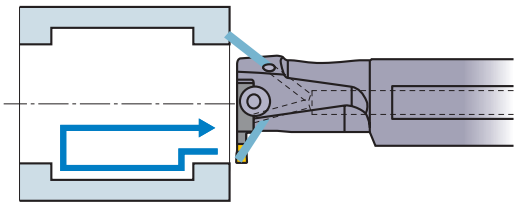
●The maximum groove depth is limited to the dimension LDRED. When machining with longer overhangs, refer to the dimension F2 of the tool used.

MACHINING RECOMMENDATIONS

Notes on multi-function machining (MF, MS, MM and BM breakers)

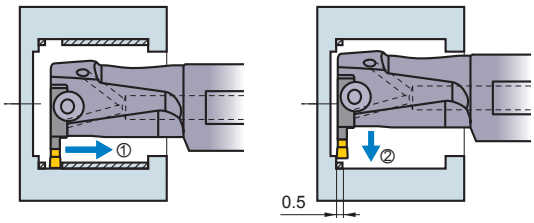
For internal grooving, the machining methods for external grooving can be used, but please note the following precautions.

Coolant



●Supply large amounts of coolant for effective chip disposal during cutting. Maintain supply until the tool has been retracted completely for improved chip disposal.

Machining blind holes

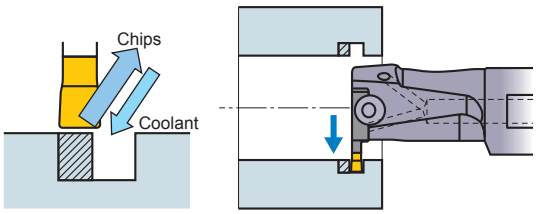


●As continuous chips tend to elongate at the back of the bore, the above operation is recommended.
The recommended width of cut for ② is 0.5mm.

Machining Wide Grooves

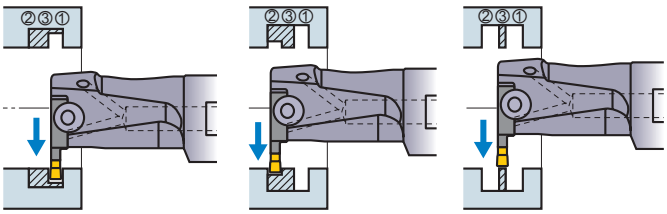
Grooving

●When the cutting edge width is x 2 ≥ groove width



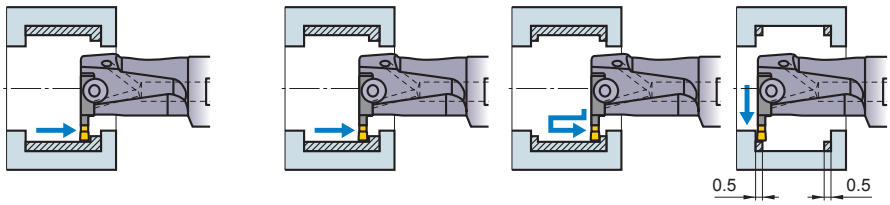
●When the depth of cut is shallower than the cutting edge width, continuous chips are usually produced. When plunging in several passes, it is recommended to carry out machining in the steps above. This ensures that coolant reaches the cutting edge and chips are easily discharged.

●When the cutting edge width is x 2 < groove width



●When the groove depth is larger than the cutting edge width, carry out plunging in the steps above to break up chips efficiently.

Turning

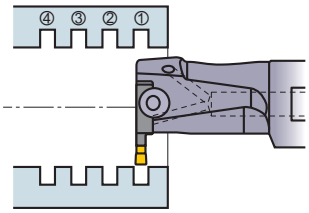


●When chip breaking and disposal are especially important, cross-feed machining is recommended.

●Wide face grooving when the corner R of the work piece is equal to the corner R of the insert, machine as shown above. (When corner R of the work piece is larger than corner R of the insert, refer to the description of external wide grooving.)

●If the groove depth exceeds a given level, chips may elongate at the wall. In such a case, increase the feed and carry out machining as shown above.

Machining instruction



●It is recommended to carry out grooving from the front end of the workpiece.
This reduces workpiece deflection.

N	Non-ferrous Metal	80 (60—100)	0.05 (—0.1)	0.3 (0.1—0.5)	5	0.1—0.5	0—0.03

*Cutting edge is not honed. Please hone according to the application before machining.

GRINDING THE CUTTING EDGE OF MICRO-MINI

●MICRO-MINI can be applied to boring and grooving as supplied. But, it can also be reground as shown below.
●For shaping and regrinding, use a diamond whetstone approximately #250—#400. Please grind according to the application using the figure below as a reference.

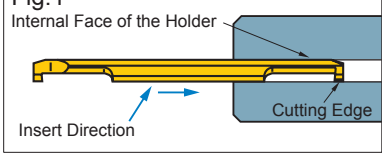
(Note) Wet cutting is recommended.

PRECAUTIONS WHEN USING THE MICRO-MINI TWIN

●When using a holder for general purpose / small automatic lathe:

1 To avoid chipping of the 2nd cutting edge take care when inserting the boring bar into the holder. Refer to fig.1. If the 2nd edge contacts the internal face of the holder there is a possibility that it may chip.

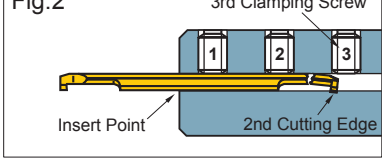
Fig.1



2 When using this type of holder, there is a possibility that damage to the shank and the 2nd cutting edge can occur. Make sure that the clamping screws are tightened to the set torque value. Additionally make sure that there is no clamping screw near the 2nd cutting edge as this can break the boring bar.

◎When using Mitsubishi holders
When using holders with a tool overhang of recommended quantity, ensure that the 3rd clamping screw is removed prior to machining. The set torque value for clamping screw is 2.0 N•m.

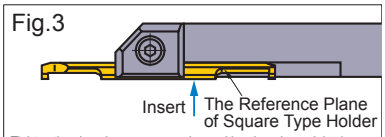
Fig.2



●When using a square type holder:

1 When installing the boring bar into the holder, tighten the clamp screws after ensuring the flats on the tool holder are parallel to the reference flats on the micro-mini bar. Refer to fig.3.
2 Make sure that the clamping screws are tightened to the recommended values.
3 Do not tighten the clamp screw without a bar in place, otherwise the bridge will be deformed.

Fig.3



Tighten the clamping screw ensuring making the micro-mini twin boring bars in contact with the reference plane of square type holder.

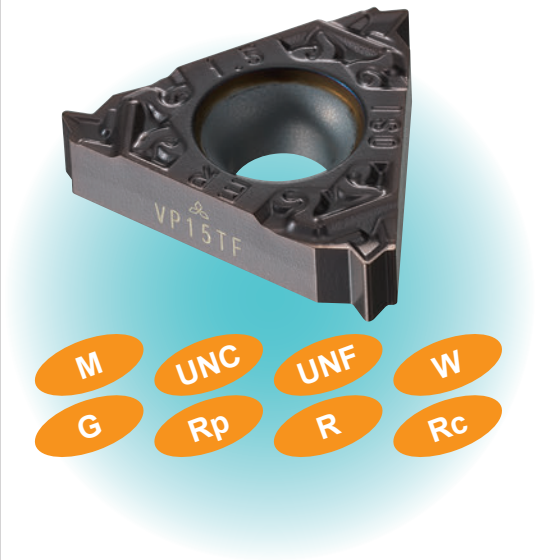
* When machining an internal UNJ thread, cut an internal hole with the appropriate diameter. Then machine with 60° American UN. In this case, a full form type insert cannot be used.

FEATURES OF MMT SERIES

A WIDE VARIETY OF PRODUCTS

Mitsubishi Miracle Threading (MMT) series. 283 inserts and 26 holders.

M-CLASS INSERTS WITH 3-D CHIP BREAKERS



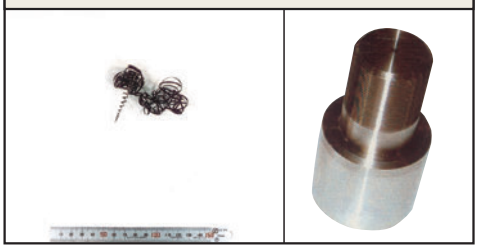
G-CLASS GROUND INSERTS

IDEAL CHIP CONTROL EVEN IN THE LATTER HALF OF PASSES WHEN CONTINUOUS CHIPS ARE USUALLY PRODUCED. (M-CLASS INSERTS WITH 3-D CHIP BREAKERS)

ISO metric external thread pitch 1.5mm Final pass (6th pass)

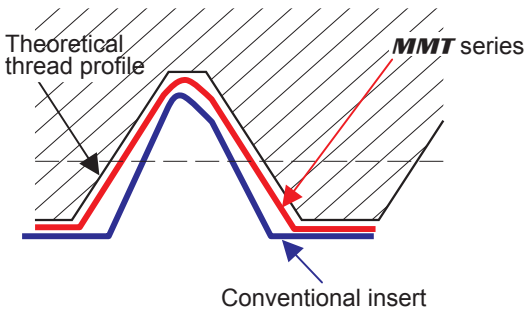
Competitor

MMT



<Cutting Conditions>
Workpiece : JIS SCM440
Insert : MMT16ER150ISO-S
Grade : VP15TF
Cutting speed : 120m/min
Cutting method : Radial Infeed
Depth of cut : Fixed cut area
Pass : 6 times
Coolant : Wet

A HIGHER LEVEL OF PRECISION THAN CONVENTIONAL INSERTS (G-CLASS GROUND INSERTS)

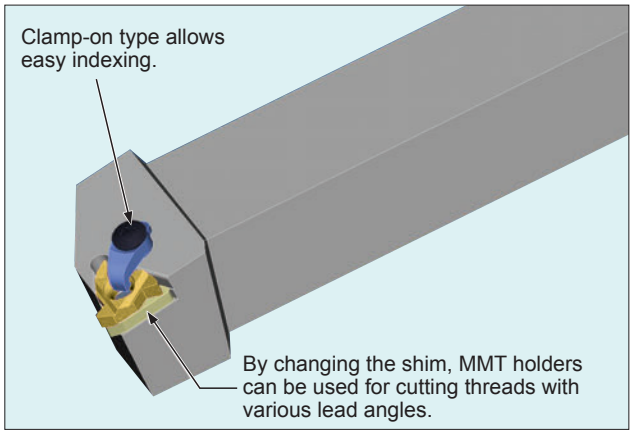


High precision threading can be achieved by using MMT inserts that feature a ground rake face and peripheral cutting edge.

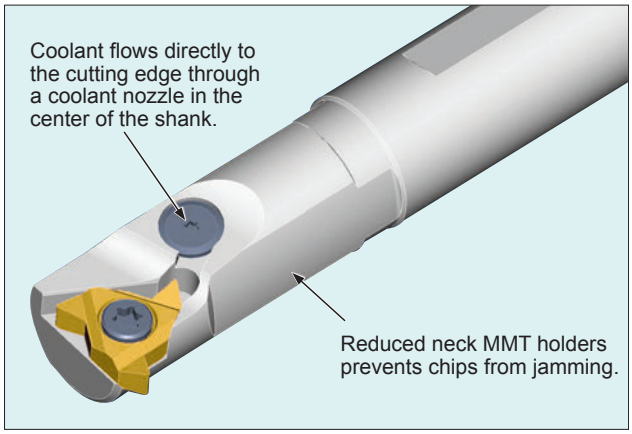
Thread Type	Threading Tolerance
ISO Metric	6g / 6H
American UN	2A / 2B
Whitworth for BSW, BSP	Medium Class A
BSPT	Standard BSPT
Round DIN 405	7h / 7H
ISO Trapezoidal 30°	7e / 7H
American ACME	3G
UNJ	3A
API Buttress Casing	Standard API
API Rounded Casing & Tubing	Standard API RD
American NPT	Standard NPT
American NPTF	Class2

HOLDER (Use of special surface treatment)

External

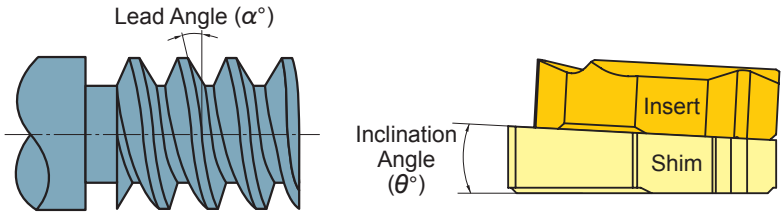


Internal



* Order number of coolant guide screw: TFS03006 (Except MMTIR1316/MMTIR1516)

SUITABLE FOR THREADING WITH A LARGE LEAD ANGLE



By changing only the shim, MMT holders can be used for turning of threads with various lead angles as well as the turning of left hand threads.

Lead Angle (α°)	Inclination Angle (θ°)
−1.5°	−3°
−0.5°	−2°
0.5°	−1°
1.5°	0°
2.5°	1°
3.5°	2°
4.5°	3°

Standard shim delivered with the holder.

GRADE

VP10MF (G-class ground insert only)

● Superior wear and plastic deformation resistance

- High wear and plastic deformation resistance for threading when maintaining the thread form is important. Suitable for continuous high precision machining with extensive tool life.
- Effective in combination with G-class inserts for high precision threading.

VP15TF (G-class ground insert, M-class insert with 3-D chip breakers)

● Wide versatility

- High fracture resistance during low rigidity applications such as bar feed machining. Able to withstand harsh conditions for long periods where conventional inserts would be liable to breakage.
- Effective combination of high cost performance M-class inserts with 3-D chip breakers.

VP20RT (M-class insert with 3-D chip breakers)

● Excellent fracture resistance

- Suitable for stainless steel boring and unstable machining where inserts are vulnerable to fracturing.
- Effective combination of high cost performance M-class inserts with 3-D chip breakers.

CHOOSING M-CLASS INSERTS WITH 3-D CHIP BREAKERS OR G-CLASS INSERTS

Insert	Chip control	Precision of thread
M-class inserts with 3-D chip breakers	◎	○

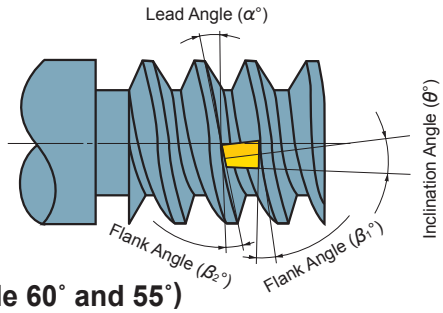
Insert	Chip control	Precision of thread
G-class inserts 	○	◎

- For ideal chip control and a high cost performance ratio, M-class inserts with 3-D chip breakers are recommended.
- G-class inserts are recommended where higher precision is required.

SELECTING A SHIM FOR THE MMT SERIES

FLANK ANGLE AND LEAD ANGLE

Lead angle (α) depends on a combination of thread diameter and pitch. Select a shim so that the lead angle of the thread can coincide with the flank angles of the thread and insert (β_1, β_2). No need to change a shim for general threading with an MMT holder. When threading with a small diameter or large pitch, change the shim depending on the lead angle, referring to the table and graph below. When threading left hand threads, change to a shim with a negative inclination angle.



SHIM REFERENCE TABLE (THREADING DIAMETER) (Thread angle 60˚ and 55˚)

Pitch (mm) \ Lead Angle	Right Hand Thread (mm)						Left Hand Thread (mm)

(Note) Back turning in the case of left hand threads.

When replacing a shim, check if the difference between the thread lead angle and shim inclination angle is within:
2.5°−0.5° where thread helix angle is 60° (55°)
2°−1° where thread helix angle is 30° (29°)
∗ Inclination angle of a standard shim is 0°.
∗ The holder has a 1.5° lead angle.

CALCULATION OF THREAD LEAD ANGLE

$$\tan\alpha = \frac{l}{\pi d} = \frac{nP}{\pi d}$$

α: Lead angle
l : Lead
n : Number of threads
P : Pitch
d : Effective diameter of thread

EXAMPLE OF SELECTING A SHIM

- When the thread lead angle is 2.2°
  ①In the case when the thread helix angle is 60°
  (2.2° lead angle) − (2.5−0.5°) = -0.3°−1.7° shim inclination angle is appropriate. Although cutting is possible even with a standard sheet (sheet inclination angle of 0°), it is recommended to replace it with a sheet from the Sheet Specification Table having an inclination angle of 1°.
  ②In the case when the thread helix angle is 30°
  (2.2° lead angle) − (2−1°) = -0.2°−1.2° shim inclination angle is appropriate. Replace with a sheet from the Sheet Specification Table having an inclination angle of 1°.

∗ Refer to the web catalogue.
http://www.carbide.mht.co.th/technical_information/tec_turning_tools/tec_threading

RELIEF ANGLE OF AN INSERT SET ON A HOLDER

Thread Helix Angle	Internal Relief Angle	External Relief Angle
60°	8.8°	5.8°
55°	7.9°	5.2°
30°	4.1°	2.7°
29°	4°	2.6°

- Relief angles (β_2, β_1) of an insert become small when the thread helix angle of a trapezoidal, round, or other thread is small. Take care when selecting a shim.

(Note)
- Set the finishing allowance on a diameter at approx. 0.1mm when using a full form insert.
- Please note the cutting depth and the number of passes when a corner radius of a partial form insert or of an internal threading insert is small to prevent damage to the insert corner.
- Please set the cutting depth sufficiently deep enough on materials such as hardened steel or austenitic stainless steel to help prevent premature wear and chipping caused by the outer layer of the material.

(Note)
- Set the finishing allowance on a diameter at approx. 0.1mm when using a full form insert.
- Please note the cutting depth and the number of passes when a corner radius of a partial form insert or of an internal threading insert is small to prevent damage to the insert corner.
- Please set the cutting depth sufficiently deep enough on materials such as hardened steel or austenitic stainless steel to help prevent premature wear and chipping caused by the outer layer of the material.

M	150	S	250
Q	180	T	300

Insert Size (mm)

11	6.35
16	9.525
22	12.7

Method of Holding

S	Screw-on
C	Clamp-on

Lead Angle

P15	1.5°
P25	2.5°
P35	3.5°

IDENTIFICATION

MMT 16 E R 100 ISO – S

Designation

Diameter of Inscribed Circle (mm)

11	6.35
16	9.525

Application

E	External
I	Internal

Hand of Tool

R	Right

Pitch

100	1.0mm	A	0.5—1.5mm or 48—16 thread/inch
125	1.25mm		
150	1.5mm	G	1.75—3.0mm or 14—8 thread/inch
175	1.75mm		
200	2.0mm		
250	2.5mm		
300	3.0mm		

Threading Type

60	Partial Profile 60°
55	Partial Profile 55°
ISO	ISO Metric
W	Whitworth for BSW, BSP
BSPT	BSPT
UN	American UN

S	M-class inserts with 3-D chip breakers

MMT 16 E R 050 ISO

Designation

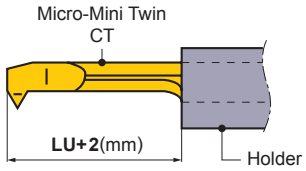
● : Inventory maintained in Japan. (MICRO-MINI TWIN is available in 1 piece in one pack.)

RECOMMENDED CUTTING CONDITIONS

	Work Material	Cutting Speed (m/min)	Recommended Tool Overhang (mm)
P	Carbon Steel Alloy Steel	50 (30－80)	
M	Stainless Steel	50 (30－80)	
K	Cast Iron	50 (30－80)	
N	Non-Ferrous Metal	80 (50－100)	



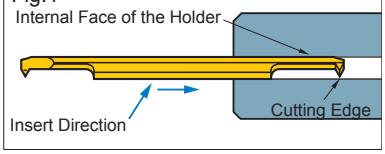
(Note 1) Wet cutting is recommended.
(Note 2) Pay special attention to machining of small diameters at high revolutions as the feed rate cannot keep up with the speed.

PRECAUTIONS WHEN USING THE MICRO-MINI TWIN

●When using a holder for general purpose / small automatic lathe:

1 To avoid chipping of the 2nd cutting edge take care when inserting the boring bar into the holder. Refer to fig.1. If the 2nd edge contacts the internal face of the holder there is a possibility that it may chip.

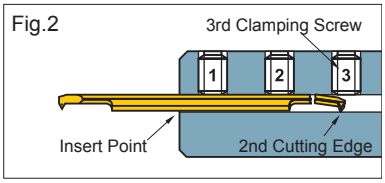
Fig.1



2 When using this type of holder, there is a possibility that damage to the shank and the 2nd cutting edge can occur. Make sure that the clamping screws are tightened to the set torque value. Additionally make sure that there is no clamping screw near the 2nd cutting edge as this can break the boring bar.

◎When using Mitsubishi holders
When using holders with a tool overhang of recommended quantity, ensure that the 3rd clamping screw is removed prior to machining. The set torque value for clamping screw is 2.0 N • m.

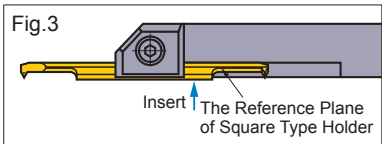
Fig.2



●When using a square type holder:

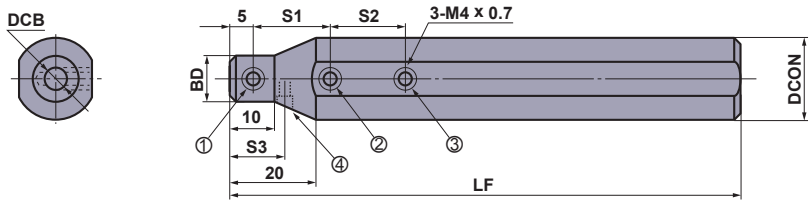
1 When installing the boring bar into the holder, tighten the clamp screws after ensuring the flats on the tool holder are parallel to the reference flats on the micro-mini bar. Refer to fig.3.
2 Make sure that the clamping screws are tightened to the recommended values.
3 Do not tighten the clamp screw without a bar in place, otherwise the bridge will be deformed.

Fig.3



Tighten the clamping screw ensuring making the micro-mini twin boring bars in contact with the reference plane of square type holder.

ROUND TYPE HOLDER



RBH22□□N has a temporary set screw for different machine specifications.
(Represented by number 4)

OUTLINE OF HSK-T TOOLS

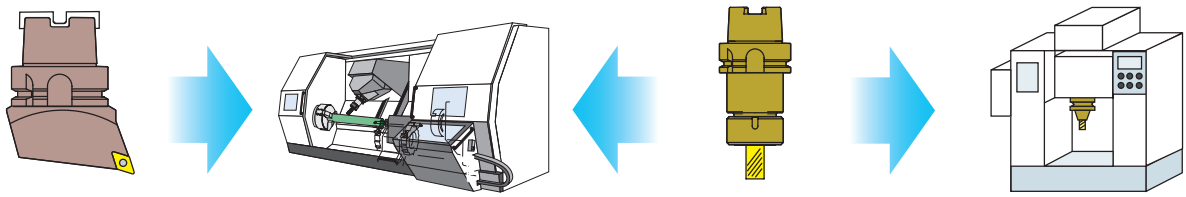
HSK-T System

HSK-T is a new HSK system designed for turning on multi-task machines that are compatible with HSK-A type (ISO standard: ISO12164-1:2001).
The HSK system was developed by a consortium of 17 Japanese manufacturers and registered in ISO standard (ISO12164-3:2008) under the name HSK-T type in 2008 and JIS standard (JIS B6064-3) in 2013.

High accuracy cutting edge positioning

The HSK-T type has a closer tolerance between the spindle key and tool holder keyway than the HSK-A type. This results in higher cutting edge positional accuracies. For milling, the conventional HSK-A type tools can be still used.

Compatible with both multi-task machines and machining centres



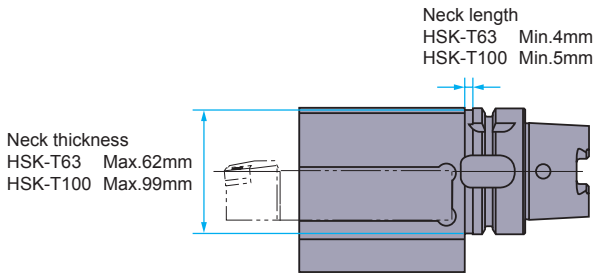
HSK-T
Turning tool holder

HSK-T spindle
Multi-task machines

HSK-A
Rotating tool holder

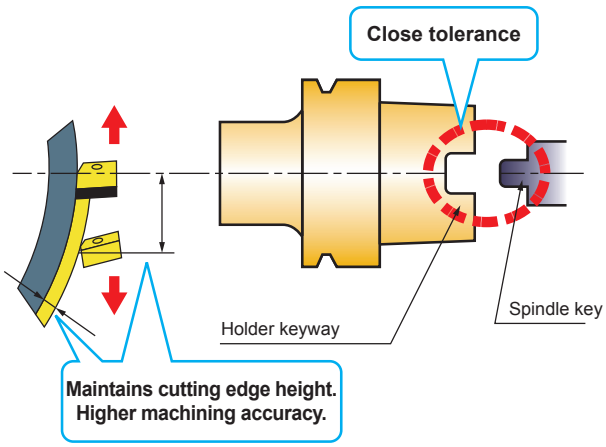
HSK-A spindle
Machining centre

*Note
Short neck length from the flange with thick body of the HSK-T turning tool as shown in the figure at the left.
Because there are machines which cannot be mounted depending on the ATC specifications of the multi-task machine(HSK-A type), please check beforehand.
Also be careful of interference of the magazine with adjacent tools.

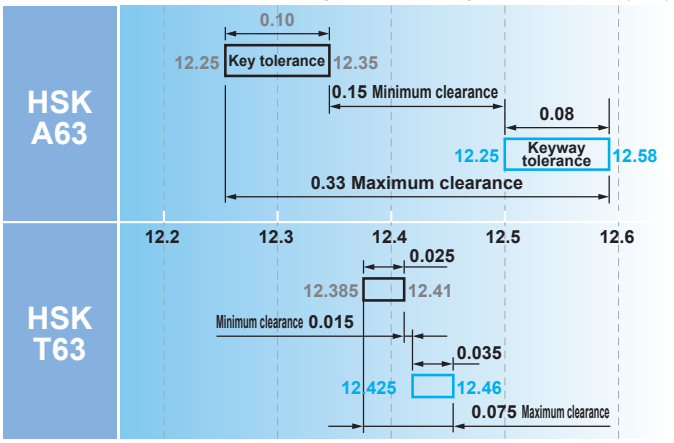


HSK-T turning tool standard (Example)

Improved keyway tolerance



Tolerance comparison (Example) (mm)

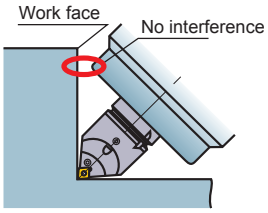


High accuracy and rigidity HSK-T type tooling system developed for use on multi-task machines.

Straight type tools suitable for use on multi-task machines

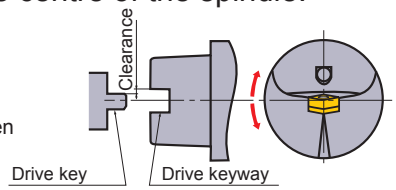
Avoid workpiece interference with improved tool accessibility.

By tilting the machines B spindle (main axis of the tool) at 45 deg, interference between the spindle, holder, workpiece and chuck can be avoided.



Improve centreline height by positioning the cutting edge at the centre of the spindle.

Increased stability and accuracy can be achieved because the cutting edge centreline height is not affected by the gap between the spindle and the key.



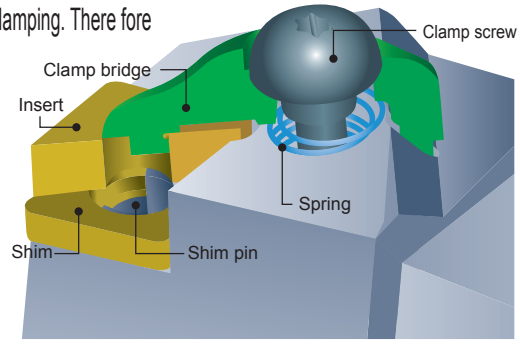
New one-action type double clamp series

The double clamp mechanism offers high rigidity, accuracy and reliability that ensures secure insert clamping. There fore making it suitable turning of difficult to machine materials such as stainless and heat resistant alloys.

Handed type for turning and facing

Straight type for turning and facing

For turning, facing and boring



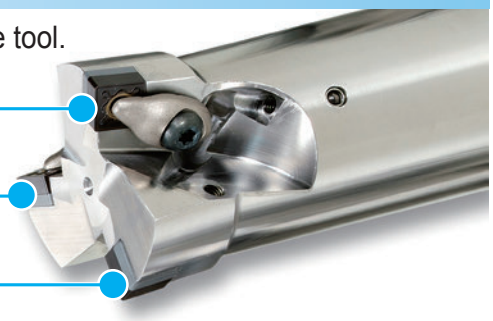
3 on 1 tool for process and tool consolidation

3 turning inserts of the same geometry can be installed on a single tool.

The same type of inserts can be installed for quick change with spare tools.

Different types of inserts can be installed for different applications (roughing, semi finishing and finishing)

Inserts in different grade types can be installed to cover various kinds of workpieces.



New HSK-T100 size for large workpieces

Larger tool holder sizes for high efficiency machining.

Square shank holder type

Boring bar / Drill type

Sleeve

A single tool can be used with different sized tool holders.

- Available for use with JIS B4126 (ISO 5610) 32x32 and 32x25 tools.
- Possible to fit a 25x25 tool by using a 7mm plate.

*Please prepare a plate on your own.

	12									0.05	0.10	0.10
	13										0.05	0.10
	14											0.06

(Note) The first pass causes a high load on the cutting edge.
In order to avoid damage, keep the depth of cut to 0.4—0.5mm maximum.

RECOMMENDED CUTTING CONDITIONS

	Work Material	Hardness	Grade	Cutting Speed (m/min)
P	Mild Steel	≤180HB	**UP20M**	140 (100—180)
			NX2525	200 (150—250)
			UTi20T	120 (100—150)
	Carbon Steel Alloy Steel	180HB—350HB	**UP20M**	120 (100—150)
			NX2525	170 (150—200)
			UTi20T	100 (70—120)
M	Stainless Steel	≤200HB	**UP20M**	120 (80—150)
			UTi20T	100 (70—130)
K	Gray Cast Iron	Tensile Strength≤350MPa	**UP20M**	80 (60—100)
			UTi20T	80 (60—100)
			HTi10	100 (70—130)

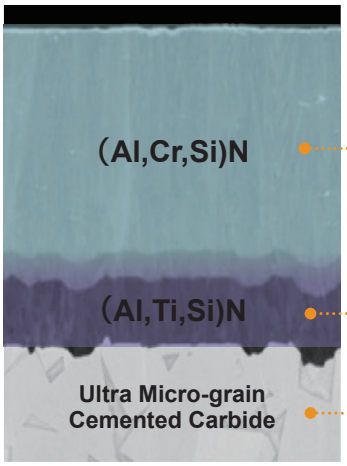
COATING TECHNOLOGY

VFR IMPACT MIRACLE REVOLUTION Coating

The combination of the (Al, Cr, Si) N coating (newly-developed), which has a high oxidation temperature and high lubricity, together with the (Al, Ti, Si) N coating, which has better wear resistance and high adhesion, allows hardened steel with even greater strength to be maintained.



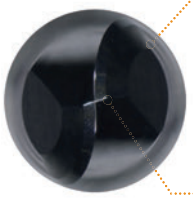
★High Oxidation Temperature
★High Lubricity

★Better Wear Resistance
★High Adhesion

Strong S Curve

New Negative Cutting Edge Shape and Slow Helix Angle Cutting Edge

New ZERO-μ Surface
Newly-developed Surface Reforming Technology



New Ball Geometry for Mirror Finish Cutting

VF ÍMPACT MIRACLE Coating

For higher hardness, higher speed and longer tool life!

In comparison with the conventional coating single-phase nano crystal coating technology offers higher coating hardness and heat resistance. When machining hardened steels it can be seen that the IMPACT MIRACLE coating offers a lower friction of coefficient and as such prevents abnormal damage such as chipping.

FEATURES OF IMPACT MIRACLE COATING

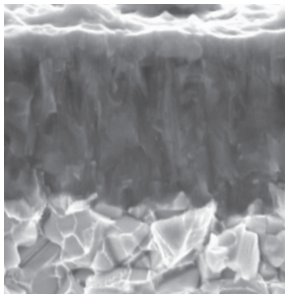
	ÍMPACT MIRACLE Shingle phase nano coating (Al,Ti,Si)N	(Al,Ti,Si)N	(Al,Ti)N
Hardness (HV)	**3700**	3200	2800
Oxidation Temperature (℃)	**1300**	1100	840
Adhesion (N)[1]	**100**	80	80
Wear Coefficient[2] (800℃)	**0.48**	0.53	0.58

1) Adhesion : Measured by critical load scratch test.
2) Coefficient of friction : Measured by ball-on-disk method.
(Counter gear : AISI D2 60HRC)

MS+ (Al,Ti,Cr)N multilayer coating (MS Plus)

Suitable coating for a broad range of workpiece materials such as carbon steel, alloy steel and hardened steel of approx. 50HRC.

Our original coating technology enables a multilayer of (Al,Ti)N and (Al,Cr)N. It allows machining of a wide range of workpiece materials.



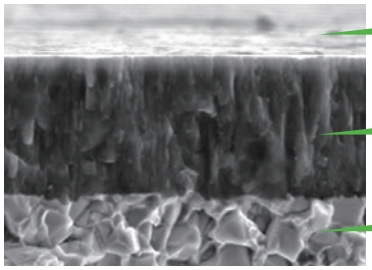
Properties of (Al,Ti,Cr)N multilayer coating (MS Plus)

	(Al,Ti,Cr)N multilayer	(Al,Ti)N	(Al,Cr)N
Hardness (HV)	**3200**	2800	3100
Oxidation Temperature (℃)	**1100**	800	1100
Adhesion (N)	**100**	80	80

MIRACLE SIGMA

VQ SMART MIRACLE® Coating

Newly-developed (Al,Cr)N coating with improved wear resistance.
The smoothig treatment of the coating layer reduces the cutting resistance and improves chip discharge significantly. This next-generation coating offers longer tool life and higher efficiency in machining difficult-to-cut materials.



Smoothed surface"Zero-μ Surface"

Newly developed(Al,Cr)N coating

Super fine grade substrate

SMART MIRACLE Coating

ZERO- μ Surface

The original surface treatment technology offers smooth coatng layer. A good balance of smooth surface and sharpe edge allows smooth chip discharge and reduces the cutting resistance. Machining efficiency and tool life is improved.

MIRACLE SIGMA

DLC DLC Coating

Newly developed DLC coating.
Hardness similar to that of CVD diamond coating achieved with high adhesion strength.

Mitsubishi Materials and NAGATA SEIKI have jointly developed a unique DLC coating that has substantially increased "adhesion strength" compared to previous DLC coatings.

DFC Diamond Coating

Proprietary CVD diamond coating produces excellent wear resistance and smooth hole surface.

The newly developed CVD diamond coated carbide material achieves outstanding abrasion resistance and smoothness due to a proprietary fine multilayer diamond crystal control technology.

DF Diamond Coating

Diamond coating for non-ferrous and new non-metal materials.

Owing to Mitsubishi's unique plasma chemical vapor deposition (CVD) coating technology, great combination of coating hardness similar to that of natural diamond has been combined with a good adhesion to carbide substrates.
DF end mill series suitable for graphite machining.

V VIOLET Coating

(Al,Ti)N coating, excellent adhesion strength for HSS tools.

Violet coating is the name of the technology of successfully applying a Miracle type coating to HSS substrate tools. The newly developed technology of applying (Al,Ti)N coating at the low temperatures required for HSS substrates, means that Violet coating has the same level of adhesion strength as Miracle coating. Additionally high film hardness and excellent oxidation resistance properties have also been realised.

SYMBOL DESCRIPTIONS

Tool material

UWC — Ultra micro grain carbide
Ultra micro grain carbide is used as the substrate material.

CBN — Cubic boron nitride
Mitsubishi's original CBN is used.

Ceramic — Ceramic
Ceramic is used as the substrate material.

KHA S — High hardness powder metallurgy HSS
High hardness powder metallurgy HSS is used as the substrate material.

KHA — Powder metallurgy HSS
Powder metallurgy HSS is used as the substrate material.

CO HSS — Ultra micro grain carbide
Cobalt high speed steel is used as the substrate material.

HSS — High speed steel
High speed steel is used as the substrate material.

Tolerances

Outside diameter tolerance
Indicates diameter tolerance of end mill.

R — R tolerance
Indicates the radial tolerance of a ball nose end mill.

R — R tolerance
Indicates the radial tolerance of an end mill with a corner radius.

Tolerance of Taper angle
Indicates the tolerance of the taper angle.

Tolerance of Point angle
Indicates the tolerance of the point angle.

h6 — Shank diameter tolerance
Indicates the shank diameter tolerance of end mill.

● : Inventory maintained.
▲ : Inventory maintained.
To be replaced by new products.
□ : Non stock, produced to order only.

Coating

VQ — SMART MIRACLE Coating
(Al, Cr)N coaitng optimum for difficult-to-cut materials.

VFR — IMPACT MIRACLE REVOLUTION Coating
A coating which adds the excellent high oxidation temperature of (AL, Cr, Si) N-based films to the nano crystal technology of VF.

VF — IMPACT MIRACLE Coating
Single phase nano crystal coating technology for higher film hardness and heat resistance.

MS+ — (Al,Ti,Cr)N multilayer coating
Offers higher versatility for carbon steel, alloy steel and hardened steel.

MS — (Al,Ti)N Coating
(Al,Ti)N offers higher versatility.

VC — MIRACLE Coating
The original Miracle (Al,Ti)N coating.
Also suitable for dry cutting.

CRN — CRN Coating
Newly developed CrN coating for Copper Electrodes machining.

DLC — DLC Coating
Hardness similar to that of CVD diamond coating achieved with high adhesion strength.
(Jointly developed with SHINMAYWA INDUSTRIES, LTD.)

DFC — CVD diamond coated end mills
Suitable for CFRP

DC — Diamond Coating
Pure Diamond high performance coating excelling in film adhesion to the substrate.

DF — Diamond Coating
Suitable for graphite machining.

V — VIOLET Coating
Increased tool life of 2—3 times that of TiN coated products.

G — TiN Coating
Increased tool life of 2—3 times that of non coated products.

Angle, sharp corner edge and gash land

Helix angle
Indicates the helix angle of the end mill.

Sharp corner edge
Indicates the end mill has a sharp corner edge.

Gash land
Indicates the end mill cutting edge has a gash land.

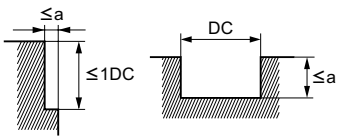
20	1900	320	4.00	1000	80	1.00



- If the depth of cut is shallow, the revolution and feed rate can be increased.
- In case of slotting with over 3 mm endmill, please reduce revolution to 50—70% of above value, and reduce feed rate to 40—60% of above value.
- When drilling, please set the feed rate at 1/3 or below of the values above.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

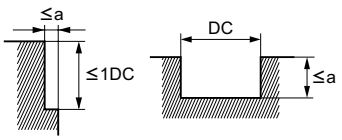
20	1900	320	4.00	1000	80	1.00



- If the depth of cut is shallow, the revolution and feed rate can be increased.
- In case of slotting with over 3 mm endmill, please reduce revolution to 50—70% of above value, and reduce feed rate to 40—60% of above value.
- When drilling, please set the feed rate at 1/3 or below of the values above.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

- When cutting austenitic stainless steel, the use of water-soluble cutting fluid is effective.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- When drilling, please set the feed rate at 1/3 or below of the values above.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

- If the depth of cut is shallow, the revolution and feed rate can be increased.
- Cutting condition may be considerably different due to the overhang (milling depth), depth of cut, and machine tools. Please see the above table as a standard.

- If the depth of cut is shallow, the revolution and feed rate can be increased.
- Cutting condition may be considerably different due to the overhang (milling depth), depth of cut, and machine tools. Please see the above table as a standard.

- When cutting austenitic stainless steel, the use of water-soluble cutting fluid is effective.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- When drilling, please set the feed rate at 1/3 or below of the values above.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

- Water-soluble cutting fluids are recommended for stainless steel and titanium alloys. Air blowing is recommended for carbon steel.
- The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

- DC=11 and 13 are specialized for slim shanks. Therefore, the recommended conditions for an overhang length of DC x 5 are indicated.
- When using a slim shank with DC=8 or 10 or 12, reduce the cutting speed by 60%, the feed rate by 80%, and the depth of cutting ae by 50% from the above conditions.
- Water-soluble cutting fluids are recommended for Stainless steel and Titanium alloys. Air blowing is recommended for carbon steel.
- The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

- If the depth of cut is shallow, the revolution and feed rate can be increased.
- When drilling, please set the feed rate at 1/3 or below of the values above.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

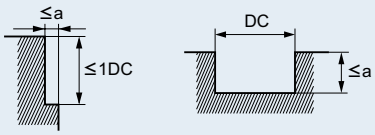
6	10000	1400	0.60	7000	700	0.30	2700	160	0.2



- When slotting, reduce the revolutions by 50 — 70% and the feed rate by 40 —60%.
- For austenitic stainless steel, titanium alloy and heat resistant alloys, the VFMHV is recommended.
- The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

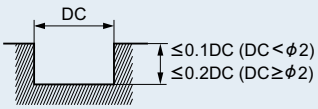
10	3200	450	2200	290	1600	110
12	2700	410	1900	260	1300	100
16	2000	340	1400	210	1000	90



- If the depth of cut is shallow, the revolution and feed rate can be increased.
- When drilling, please set the feed rate at 1/3 or below of the values above.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

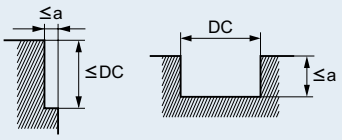
12	5400	820	1.00	3800	450	0.50
16	2400	380	3.00	1200	100	0.80
20	1900	320	4.00	1000	80	1.00



- If the depth of cut is shallow, the revolution and feed rate can be increased.
- In case of slotting with over 3 mm endmill, please reduce revolution to 50—70% of above value, and reduce feed rate to 40—60% of above value.
- When drilling, please set the feed rate at 1/3 or below of the values above.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

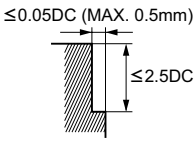
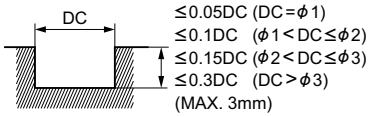
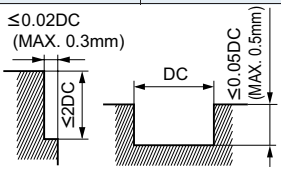
5	2900	100(60)	2300	80(40)	1800(1350)	60(25)	1500	40(20)
6	2500	120(60)	2000	100(50)	1500(1100)	75(30)	1300	50(25)
8	1900	130(60)	1500	100(50)	1200(900)	85(35)	1000	50(25)
10	1600	130(60)	1300	100(50)	950(710)	75(30)	800	50(25)
12	1300	120(60)	1100	90(45)	800(600)	60(25)	670	40(20)
16	1000	80(40)	820	65(30)	600(450)	45(20)	500	30(15)
20	800	65(30)	650	50(25)	480(360)	40(15)	400	25(13)
25	650	50(25)	520	40(20)	380(280)	30(12)	320	20(10)







- When cutting austenitic stainless steel, the use of water-soluble cutting fluid is effective.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- When drilling, please set the feed rate at 1/3 or below of the values above.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

5	25	12000	1500	0.35
6	30	10000	1200	0.40

- If the depth of cut is shallow, the revolution and feed rate can be increased.
- The use of water-soluble coolant is recommended.
- Cutting condition may be considerably different due to the overhang (milling depth), depth of cut, and machine tools. Please see the above table as a standard.

- The cutting conditions above are a guide only to milling within the standard depth of cut.
- Ductile cast iron milling has the same cutting conditions as carbon steel and alloy steel. (180— 280HB)
- When drilling, please set the feed rate at 1/3 or below of the values above.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

- The use of water-soluble coolant is recommended.
- Climb cutting is recommended for side milling.
- If tool clamping is poor, the tool can be pulled out of the holder. Ensure that the tool is sufficiently clamped.
- This table shows the cutting condition with less than 4DC overhang length. If more than 4DC, spindle speed, feed rate and depth of cut should be reduced.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

- When cutting austenitic stainless steel, the use of water-soluble cutting fluid is effective.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

- When cutting austenitic stainless steel, the use of water-soluble cutting fluid is effective.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- When drilling, please set the feed rate at 1/3 or below of the values above.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

- SMART MIRACLE Coating is not energized because of its nature. Therefore, an external contact (voltaic type) tool setter cannot be used. An internal contact (non-voltaic) type or laser type tool setter is recommended to measure the length of the tool. An internal contact (non-voltaic) type or laser type tool setter is recommended to measure the length of the tool.
- For stainless steel, titanium alloy and heat resistant alloy, the use of water-soluble coolant is effective
- The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abonrmal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.
- If the depth of cut is shallow, the revolution and feed rate can be increased.

VQMHZV

·Slotting

The rigidity of the machine or workpiece and chip discharge are sufficient at high efficiency conditions.

The rigidity of the machine or workpiece or chip discharge is insufficient at general-purpose conditions.

- SMART MIRACLE Coating is not energized because of its nature. Therefore, an external contact (voltaic type) tool setter cannot be used. An internal contact (non-voltaic) type or laser type tool setter is recommended to measure the length of the tool. An internal contact (non-voltaic) type or laser type tool setter is recommended to measure the length of the tool.
- For stainless steel, titanium alloy and heat resistant alloy, the use of water-soluble coolant is effective
- The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abonrmal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.
- When the Depth of cut is small, the feed rate can be increased.

·Plunging

The rigidity of the machine or workpiece and chip discharge are sufficient at high efficiency conditions.

The rigidity of the machine or workpiece or chip discharge is insufficient at general-purpose conditions.

- If the depth of cut is shallow, the revolution and feed rate can be increased.
- The above table shows cutting conditions for standard side milling. For slotting, please set the revolution at 80 — 100% and the feed rate at 60 —80% of the table figure. Please set the revolution rate at 60% and the feed rate at 40% when slotting austenitic stainless steels.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

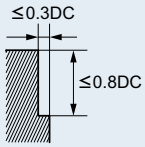
RECOMMENDED CUTTING CONDITIONS

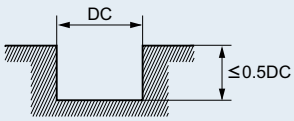
·Side milling

Work material	Aluminium alloy A7075	
Dia. DC(mm)	Revolution (min⁻¹)	Feed rate (mm/min)
12	13000	5400
16	10000	5400
18	9000	5000
20	8000	5000
25	6000	4500



·Slotting

Work material	Aluminium alloy A7075	
Dia. DC(mm)	Revolution (min⁻¹)	Feed rate (mm/min)
12	13000	3200
16	10000	3200
18	9000	3000
20	8000	3000
25	6000	2800



- The use of water-soluble coolant is recommended.
- Climb cutting is recommended for side milling.
- This table shows the cutting condition with less than 4DC overhang length. If more than 4DC, spindle speed, feed rate and depth of cut should be reduced.
- These end mills do not have a centre cutting edge, therefore when entering a workpiece use a ramping process rather than vertical feed.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately, or set the depth of cut smaller.

- When cutting austenitic stainless steel, the use of water-soluble cutting fluid is effective.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

- If the depth of cut is shallow, the revolution and feed rate can be increased.
- In case of slotting with over 3 mm endmill, please reduce revolution to 50—70% of above value, and reduce feed rate to 40—60% of above value.
- When drilling, please set the feed rate at 1/3 or below of the values above.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

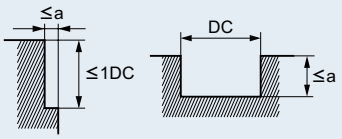
20	1900	480	4.00	1000	100	1.00



- If the depth of cut is shallow, the revolution and feed rate can be increased.
- In case of slotting with over 3 mm endmill, please reduce revolution to 50—70% of above value, and reduce feed rate to 40—60% of above value.
- When drilling, please set the feed rate at 1/3 or below of the values above.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

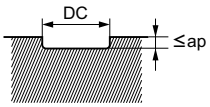
M54XL

Work material		Carbon steel, Cast iron, Alloy steel, Pre-hardened steel AISI 1050, AISI No 35 B, AISI P20, AISI P21		
Dia. DC(mm)	Neck length LU(mm)	Revolution (min^{-1})	Feed rate (mm/min)	Depth of cut ap(mm)
	80	1600	320	0.30



- If the depth of cut is shallow, the revolution and feed rate can be increased.
- Cutting condition may be considerably different due to the overhang (milling depth), depth of cut, and machine tools. Please see the above table as a standard.

20	1900	480	4.00	1000	240	1.00	800	100	0.30

- When slotting, reduce the revolutions by 50 — 70% and the feed rate by 40 —60%.
- For austenitic stainless steel, titanium alloy and heat resistant alloys, the VFMHV is recommended.
- The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

- When cutting austenitic stainless steel, the use of water-soluble cutting fluid is effective.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

- SMART MIRACLE Coating is not energized because of its nature. Therefore, an external contact (voltaic type) tool setter cannot be used. An internal contact (non-voltaic) type or laser type tool setter is recommended to measure the length of the tool.
- For stainless steel, titanium alloy and heat resistant alloy, the use of water-soluble coolant is effective.
- The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.
- If the depth of cut is shallow, the revolution and feed rate can be increased.

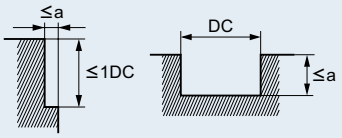
20	1900	480	3.00	1000	100	1.00



- If the depth of cut is shallow, the revolution and feed rate can be increased.
- In case of slotting with over 3 mm endmill, please reduce revolution to 50—70% of above value, and reduce feed rate to 40—60% of above value.
- When drilling, please set the feed rate at 1/3 or below of the values above.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

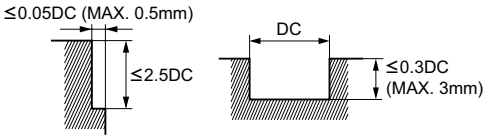
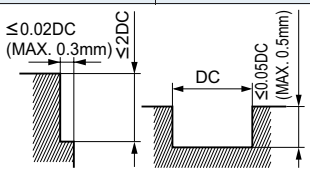
25	650	85	520	70	380	50	320	35





- When cutting austenitic stainless steel, the use of water-soluble cutting fluid is effective.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- The above table shows cutting conditions for standard side milling. For slotting, please reduce the feed rate only to 50% of the table figure. Please set the revolution rate at 60% and the feed rate at 40% when slotting austenitic stainless steels.
- When drilling, please set the feed rate at 1/3 or below of the values above.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

- If the depth of cut is shallow, the revolution and feed rate can be increased.
- The above condition are for shoulder milling. For slotting φ3 or larger diameters, set the revolution, feed rate and depth of cut at 20 — 40% of the table figures.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

·Slot milling with small diameter tools
