- SMART MIRACLE Coating is not energized because of its nature. Therefore, an external contact (voltaic type) tool setter cannot be used. An internal contact (non-voltaic) type or laser type tool setter is recommended to measure the length of the tool.
- For stainless steel, titanium alloy and heat resistant alloy, the use of water-soluble coolant is effective.
- The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.
- If the depth of cut is shallow, the revolution and feed rate can be increased.

VQSVR

·Slotting

The rigidity of the machine or workpiece and chip discharge are sufficient at high efficiency conditions.

The rigidity of the machine or workpiece or chip discharge is insufficient at general-purpose conditions.

High efficiency conditions

- If the depth of cut is shallow, the revolution and feed rate can be increased.
- The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

- When cutting austenitic stainless steel, the use of water-soluble cutting fluid is effective.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

- If the depth of cut is shallow, the revolution and feed rate can be increased.
- The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

- α is the inclination angle of the machined surface.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.
- Standard cutting conditions of austenitic stainless steel, and titanium alloy, please reduce to 60% revolution and 45% feed rate. (Hardened steel (45 — 55HRC) table above)

- α is the inclination angle of the machined surface.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

MP2XLB

MS PLUS END MILLS

Ball nose, Short cut length, 2 flute, Long neck

- When the inclination angle of machined surface is large, or machining with large cutting load such as corner area, reduce the revolution and feed rate.
- The use of oil mist is recommended when machining with small diameter.
- The revolution and feed rate can increase for the small depth of cut (ap).
- Cutting condition may be considerably different due to the overhang (milling depth), depth of cut, and machine tools. Please see the above table as a standard.
- For hardened steel over 55HRC, use VF2XLB.
- Standard cutting conditions of austenitic stainless steel and titanium alloy, please reduce to 60% revolution and 45% feedrate. (Hardened steel (45 — 55HRC) table above)

- α is the inclination angle of the machined surface.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

- If the depth of cut is shallow, the revolution and feed rate can be increased.
- Cutting condition may be considerably different due to the overhang (milling depth), depth of cut, and machine tools. Please see the above table as a standard.

Depth of cut	≤0.2RE ≤Please refer to the list above for depth of cut. RE : Radius																	

1) If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.
2) If the depth of cut is shallow, the revolution and feed rate can be increased. Please reduce the feed rate when the surface finish is important.
3) α is the inclination angle of the machined surface.

Depth of cut												

1) The tools are recommended for use only in finish machining.
2) Air blowing and oil mist are recommended as coolants.
3) Note the following points when using the tools.
   - Avoid using equipment abruptly without proper preparation. After sufficiently energizing equipment, ensure that there will be no changes to the depth of cut such as due to elongation of the main axis during machining.
   - If the tools are used immediately after rough machining of a surface, large uneven areas (cusp heights) will cause deflection of the tools and waviness of the machined surface. Therefore, it is recommended to add a medium finish machining process which uses the same value of ae as indicated in the table above.
4) α is the inclination angle of the machined surface.

- α is the inclination angle of the machined surface.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

- α is the inclination angle of the machined surface.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

- If the depth of cut is shallow, the revolution and feed rate can be increased.
- Cutting condition may be considerably different due to the overhang (milling depth), depth of cut, and machine tools. Please see the above table as a standard.

- If the depth of cut is shallow, the revolution and feed rate can be increased.
- Cutting condition may be considerably different due to the overhang (milling depth), depth of cut, and machine tools. Please see the above table as a standard.

- α is the inclination angle of the machined surface.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

·Using general machining center or NC milling machine. (Large depth of cut ≦0.8RE)

- α is the inclination angle of the machined surface.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

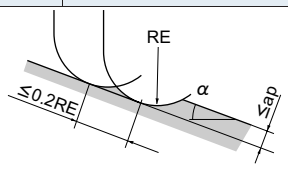
R6	9000	3600	6000	1300	0.50



- α is the inclination angle of the machined surface.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- The use of water-soluble coolant is recommended.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

CRN2XLB

CRN END MILLS

Ball nose, Medium cut length, 2 flute, Long neck, For copper electrodes

Product Information

- If the depth of cut is shallow, the revolution and feed rate can be increased.
- The use of water-soluble coolant is recommended.
- Cutting condition may be considerably different due to the overhang (milling depth), depth of cut, and machine tools. Please see the above table as a standard.

- α is the inclination angle of the machined surface.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

- When cutting austenitic stainless steel, the use of water-soluble cutting fluid is effective.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.
- α is the inclination angle of the machined surface.

- SMART MIRACLE Coating is not energized because of its nature. Therefore, an external contact (voltaic type) tool setter cannot be used. An internal contact (non-voltaic) type or laser type tool setter is recommended to measure the length of the tool.
- For stainless steel, titanium alloy and heat resistant alloy, the use of water-soluble coolant is effective.
- The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- α is the inclination angle of the machined surface.

- If the depth of cut is shallow, the revolution and feed rate can be increased.
- In case of slotting with over 3 mm endmill, please reduce revolution to 50—70% of above value, and reduce feed rate to 40—60% of above value.
- When drilling, please set the feed rate at 1/3 or below of the values above.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

LU=2D						
LU=5D						

- When cutting austenitic stainless steel, the use of water-soluble cutting fluid is effective.
- If the depth of cut is shallow, the revolution and feed rate can be increased.

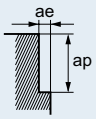
20	2400	1200	34	4	1900	840	34	4	1600	670	34	4	1100	260	34	1



- When using a slim shank with DC=10 or 12, reduce the cutting speed by 60%, the feed rate by 80%, and the depth of cutting ae by 50% from the above conditions.
- Water-soluble cutting fluids are recommended for stainless steel and titanium alloys. Air blowing is recommended for carbon steel.
- The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

·Slotting

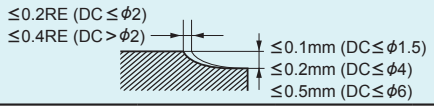
Depth of cut



DC:Dia.

1) The cutting conditions above are a guide only to machining with cutting edges with a corner radius. When machining with peripheral cutting edges, use the minimum feed rate as a guide.
2) If the depth of cut is shallow, the revolution and feed rate can be increased.
3) For profile machining such as moulds, machining conditions may differ considerably depending on the workpiece geometry, machining methods and depth of cut. Reduce the feed rate especially when machining the corner sections of a workpiece.
4) If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

- The cutting conditions above are a guide only to machining with cutting edges with a corner radius. When machining with peripheral cutting edges, use the minimum feed rate as a guide.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- For profile machining such as moulds, machining conditions may differ considerably depending on the workpiece geometry, machining methods and depth of cut. Reduce the feed rate especially when machining the corner sections of a workpiece.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

- If the depth of cut is shallow, the revolution and feed rate can be increased.
- The use of water-soluble coolant is recommended.
- Cutting condition may be considerably different due to the overhang (milling depth), depth of cut, and machine tools. Please see the above table as a standard.

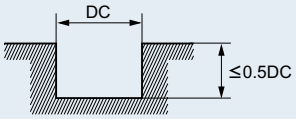
16	10000	3200
18	9000	3000
20	8000	3000
25	6000	2800



- The use of water-soluble coolant is recommended.
- Climb cutting is recommended for side milling.
- This table shows the cutting condition with less than 4DC overhang length. If more than 4DC, spindle speed, feed rate and depth of cut should be reduced.
- These end mills do not have a centre cutting edge, therefore when entering a workpiece use a ramping process rather than vertical feed.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately, or set the depth of cut smaller.

- When cutting austenitic stainless steel, the use of water-soluble cutting fluid is effective.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- When drilling, please set the feed rate at 1/3 or below of the values above.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

- When ramping process set the feed rate at 50%. A ramping angle of 1° is recommended.
- Use at a revolution of 70% and feed rate of 50% when the tool overhang exceeds 5DC.

VFHVRB

IMPACT MIRACLE END MILLS

4 flute, Corner radius, Short cut length, Irregular helix flutes

- If the depth of cut is shallow, the revolution and feed rate can be increased.
- Air blow or oil mist is recommended for good chip evacuation.
- For profile machining such as moulds, machining conditions may differ considerably depending on the workpiece geometry, machining methods and depth of cut. Reduce the feed rate especially when machining the corner sections of a workpiece.
- The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

VFHVRB

·High depth of cut conditions

- If the depth of cut is shallow, the revolution and feed rate can be increased.
- Air blow or oil mist is recommended for good chip evacuation.
- For profile machining such as moulds, machining conditions may differ considerably depending on the workpiece geometry, machining methods and depth of cut. Reduce the feed rate especially when machining the corner sections of a workpiece.
- The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

VFHVRB

IMPACT MIRACLE END MILLS

4 flute, Corner radius, Short cut length, Irregular helix flutes

- If the depth of cut is shallow, the revolution and feed rate can be increased.
- Air blow or oil mist is recommended for good chip evacuation.
- For profile machining such as moulds, machining conditions may differ considerably depending on the workpiece geometry, machining methods and depth of cut. Reduce the feed rate especially when machining the corner sections of a workpiece.
- The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

- When cutting austenitic stainless steel, the use of water-soluble cutting fluid is effective.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

VFMHVRBCH

COOL STAR END MILLS

Corner radius end mill, Medium cut length, 4 flute, Irregular helix flutes, with multiple internal through coolant holes

- SMART MIRACLE Coating is not energized because of its nature. Therefore, an external contact (voltaic type) tool setter cannot be used. An internal contact (non-voltaic) type or laser type tool setter is recommended to measure the length of the tool.
- For stainless steel, titanium alloy and heat resistant alloy, the use of water-soluble coolant is effective.
- The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.
- If the depth of cut is shallow, the revolution and feed rate can be increased.

VQMHVRB

·Slotting

The rigidity of the machine or workpiece and chip discharge are sufficient at high efficiency conditions.

The rigidity of the machine or workpiece or chip discharge is insufficient at general-purpose conditions.

- If the depth of cut is shallow, the revolution and feed rate can be increased.
- In case of slotting with over 3 mm endmill, please reduce revolution to 50—70% of above value, and reduce feed rate to 40—60% of above value.
- When drilling, please set the feed rate at 1/3 or below of the values above.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

- When cutting austenitic stainless steel, the use of water-soluble cutting fluid is effective.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- The above table shows cutting conditions for standard side milling. For slotting, please reduce the feed rate only to 50% of the table figure. Please set the revolution rate at 60% and the feed rate at 40% when slotting austenitic stainless steels.
- When drilling, please set the feed rate at 1/3 or below of the values above.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

VCHFRB

- The cutting conditions above are a guide only to machining with cutting edges with a corner radius.
- This table shows the cutting conditions with less than 5DC overhang length. In the case of longer overhangs, the revolution and the feed rate should be reduced proportionately.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- Air blow or oil mist is recommended for good chip evacuation.
- For profile machining such as moulds, machining conditions may differ considerably depending on the workpiece geometry, machining methods and depth of cut. Reduce the feed rate especially when machining the corner sections of a workpiece.
- When machining inclinations in the Z direction, set the inclination angle at 2° and reduce the feed rate by 50%.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

VCHFRB

- The cutting conditions above are a guide only to machining with cutting edges with a corner radius.
- This table shows the cutting conditions with less than 5D overhang length. In the case of longer overhangs, the revolution and the feed rate should be reduced proportionately.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- Air blow or oil mist is recommended for good chip evacuation.
- For profile machining such as moulds, machining conditions may differ considerably depending on the workpiece geometry, machining methods and depth of cut. Reduce the feed rate especially when machining the corner sections of a workpiece.
- When machining inclinations in the Z direction, set the inclination angle at 2° and reduce the feed rate by 50%.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

- When cutting austenitic stainless steel, the use of water-soluble cutting fluid is effective.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

- When high machining accuracy is needed, or the workpiece becomes chipped, we recommend lowering the feed rate.
- Use a milling machine dedicated for graphite.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

- When cutting austenitic stainless steel, the use of water-soluble cutting fluid is effective.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

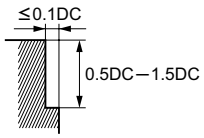
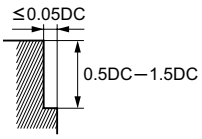
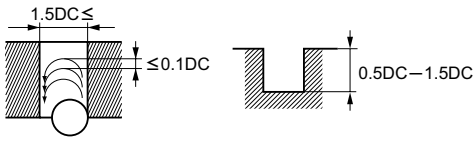
12	4000	2000	1100	230
16	3000	1600	800	180
20	2400	1400	640	150





·Trochoidal slotting

Work material	Austenitic stainless steel, Titanium alloy AISI 304, AISI 306, Ti-6Al-4V	
Dia. DC(mm)	Revolution (min^{-1})	Feed rate (mm/min)
10	4800	1400
12	4000	1200
16	3000	1100
20	2400	900



- If the depth of cut is shallow, the revolution and feed rate can be increased.
- The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

VF8MHVRBCH COOL STAR END MILLS

Corner radius end mill, Medium cut length, 8 flute, Irregular helix flutes, with multiple internal through coolant holes

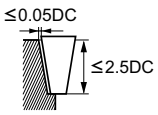
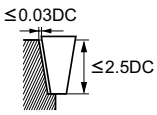
10	1900	600	1600	410	1300	240





- If the depth of cut is shallow, the revolution and feed rate can be increased.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

MS4LT

MSTAR END MILLS

Taper end mill, Long cut length, 4 flute

- If the depth of cut is shallow, the revolution and feed rate can be increased.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

- If the depth of cut is shallow, the revolution and feed rate can be increased.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

MS2MTB

MSTAR END MILLS

Ball nose taper end mill, Medium cut length, 2 flute

- α is the inclination angle of the machined surface.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

MS4LTB

MSTAR END MILLS

Ball nose, 4 flute, Taper, For rib milling

- If the depth of cut is shallow, the revolution and feed rate can be increased.
- Cutting condition may be considerably different due to the overhang (milling depth), depth of cut, and machine tools. Please see the above table as a standard.

- α is the inclination angle of the machined surface.
- When cutting a very hard workpiece, reduce the feed rate.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

- The cemented carbide in the above mentioned cutting conditions table is based on CIS standard VM-40(90HRA).
- Air blow or dry processing is recommended with cemented carbide processing. *Note: Using coolants or oil mists may decrease tool longevity.
- The use of a water soluble cutting oil is recommended with the processing of hard brittle materials other than the cemented carbide mentioned in the above table. Be sure to refuel the oil and eliminate any chip discharge that adheres to the tool.
- Cutting conditions may need adjustments depending on the type of work material.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.
- Implementation of special countermeasures is recommended since fine chip discharge may enter gaps in the processing machinery.

- When high machining accuracy is needed, or the workpiece becomes chipped, we recommend lowering the feed rate.
- Use a milling machine dedicated for graphite.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

- When high machining accuracy is needed, or the work materials becomes chipped, we recommend lowering the feed rate.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.
- When drying and machining work materials that contain resin, be careful of tool breakage and mechanical problems (as there is a possibility of blockage caused by cutting chips).
- Use a milling machine dedicated for graphite.

- When high machining accuracy is needed, or the workpiece becomes chipped, we recommend lowering the feed rate.
- Use a milling machine dedicated for graphite.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

- Supply cutting fluid sufficiently during slot milling. When slotting with dry cut, decrease the revolution and feed rate proportionately by 20 —30%.
- When drilling, please set the feed rate at 1/3 or below of the values above.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

- Supply cutting fluid sufficiently during cutting. When slotting with dry cut, decrease the revolution and feed rate proportionately by 20—50%.
- For smaller depths and widths of cut, the revolution may be increased by 10 — 20% and the feed rate by 10 —40%.
- When drilling, please set the feed rate at 1/3 or below of the values above.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

RECOMMENDED CUTTING CONDITIONS

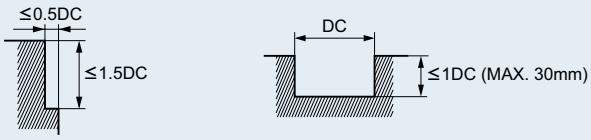
( ) : Indicates standard revolution and feed rate for slotting.

Work material	Structural steel, Cast iron, Carbon steel AISI 1045, AISI No 35 B, AISI 1050		Carbon steel, Alloy steel (20—30HRC) AISI 1055, AISI P20		Alloy steel, Tool steel, Pre-hardened steel (30—35HRC) AISI H13, AISI D2		Austenitic stainless steel AISI 304, AISI 316	
Dia. DC(mm)	Revolution (min^{-1})	Feed rate (mm/min)	Revolution (min^{-1})	Feed rate (mm/min)	Revolution (min^{-1})	Feed rate (mm/min)	Revolution (min^{-1})	Feed rate (mm/min)
5	1000(750)	40(30)	760(570)	30(25)	610(460)	25(20)	510(380)	20(15)
6	960(720)	50(40)	720(540)	40(30)	570(430)	30(25)	480(360)	25(20)
8	800(600)	65(50)	600(450)	50(40)	500(380)	40(30)	400(300)	30(25)
10	640(480)	90(70)	480(360)	70(55)	380(290)	50(40)	320(240)	40(30)
12	530(400)	90(70)	400(300)	70(55)	320(240)	55(40)	270(200)	45(35)
16	400(300)	90(70)	300(230)	70(55)	240(180)	55(40)	200(150)	45(35)
20	320(240)	95(70)	240(180)	70(55)	190(140)	55(40)	160(120)	45(35)
25	250(190)	90(70)	190(140)	65(50)	150(110)	50(40)	130(100)	45(35)
30	210(160)	85(65)	160(120)	65(50)	130(100)	50(40)	110(85)	45(35)
40	135(100)	60(45)	100(75)	45(40)	80(60)	35(26)	70(55)	30(25)
50	100(75)	50(40)	75(55)	40(30)	60(45)	30(23)	50(40)	25(20)



- Supply cutting fluid sufficiently during cutting.
- When the diameter exceeds ø30 and the metal removal is less than the quantity shown in the table, the revolution and feed rate may be increased proportionately by 10 —40%.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

- Supply cutting fluid sufficiently during cutting.
- When the diameter exceeds ø30 and the metal removal is less than the quantity shown in the table, the revolution and feed rate may be increased proportionately by 10 —40%.
- If the rigidity of the machine or the work materials installation is very low, or chattering and noise are generated, reduce the revolution and feed rate proportionately.

- If the depth of cut is shallow, the revolution and feed rate can be increased.
- Oil mist coolant is recommended.
- Cutting condition may be considerably different due to the overhang (milling depth), depth of cut, and machine tools. Please see the above table as a standard.

IMX25	For 25mm

④ Shank diameter

ex.
12 → 12mm

⑤ Neck Length

ex.
N017 → 17.∗mm
(Truncate decimal places)

⑦ Tool material

C	CARBIDE
S	STEEL

RUN-OUT ACCURACY AND HEAD EXCHANGE ACCURACY

Unit : mm

Dia. DC	Run-out accuracy for the peripheral cutting edge	Head exchange accuracy (Axial)
<ø25	0.015	±0.02
≥ø25	0.020	

CORRECTION FACTOR BY OVERHANG LENGTH (SIDE MILLING)

Use by multiplying the recommended cutting condition on the next page by the correction factor by overhang length.
Refer to each recommended condition for the long cutting and offset type.

- For stainless steel, titanium alloy and heat resistant alloy, the use of water-soluble coolant is effective.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- The irregular helix flute end mill has a large effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

- For stainless steel, titanium alloy and heat resistant alloy, the use of water-soluble coolant is effective.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- The irregular helix flute end mill has a large effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.
- The length of the long cutting type is 2 times that of the standard head. L/D demonstrates +1 when installed to a holder of the same size.

Work material	Aluminium alloy A6061, A7075					
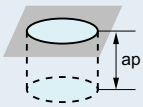
Dia. DC(mm)	Cutting speed (m/min)	Revolution (min^{-1})	Feed per Revolution (mm/rev)	Table Feed (mm/min)	Depth of cut Depth ap(mm)	Step ap2(mm)
10	300	9600	0.100	960	5	3
12	300	8000	0.100	800	6.0	2.5
16	300	6000	0.100	600	8.0	2.5
20	300	4800	0.100	480	10	3
25	300	3800	0.100	380	13	2.5



- The use of water-soluble coolant is recommended.
- Vibration may occur if the rigidity of machine or work piece is low. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

Depth of cut		 DC:Dia.									

1) For stainless steel, titanium alloy and heat resistant alloy, the use of water-soluble coolant is effective.
2) If the depth of cut is shallow, the revolution and feed rate can be increased.
3) The irregular helix flute end mill has a large effect on controlling vibration when compared to standard end mills.
However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur.
In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.
4) α is the inclination angle of the machined surface.

- For stainless steel, titanium alloy and heat resistant alloy, the use of water-soluble coolant is effective.
- If the depth of cut is shallow, the revolution and feed rate can be increased.
- The irregular helix flute end mill has a large effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.
- The length of the long cutting type is 2 times that of the standard head. L/D demonstrates +1 when installed to a holder of the same size.

- The irregular helix flute end mill has a large effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.
- For stainless steel, titanium alloy and heat resistant alloy, the use of water-soluble coolant is effective.
- If the depth of cut is shallow, the revolution and feed rate can be increased.

- If the depth of cut is shallow, the revolution and feed rate can be increased.
- Air blow or oil mist is recommended for good chip evacuation.
- For profile machining such as moulds, machining conditions may differ considerably depending on the workpiece geometry, machining methods and depth of cut. Reduce the feed rate especially when machining the corner sections of a workpiece.
- The irregular helix flute end mill has a larger effect on controlling vibration when compared to standard end mills. However, if the rigidity of the machine or the workpiece installation is poor, vibration or abnormal sound can occur. In this case, please reduce the revolution and feed rate proportionately, or set a lower depth of cut.

- For stainless steel, titanium alloy and heat resistant alloy, the use of water-soluble coolant is effective.
- Vibration may occur if the rigidity of machine or work piece is low. In this case, please reduce the revolution and feed rate proportionately.

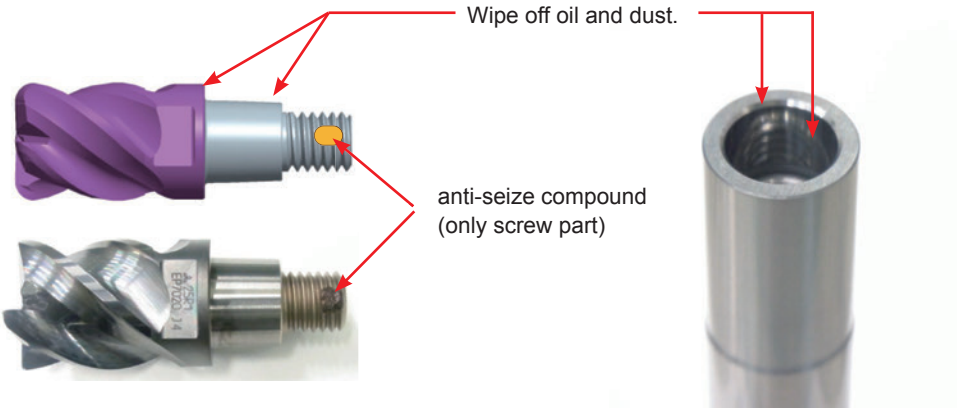
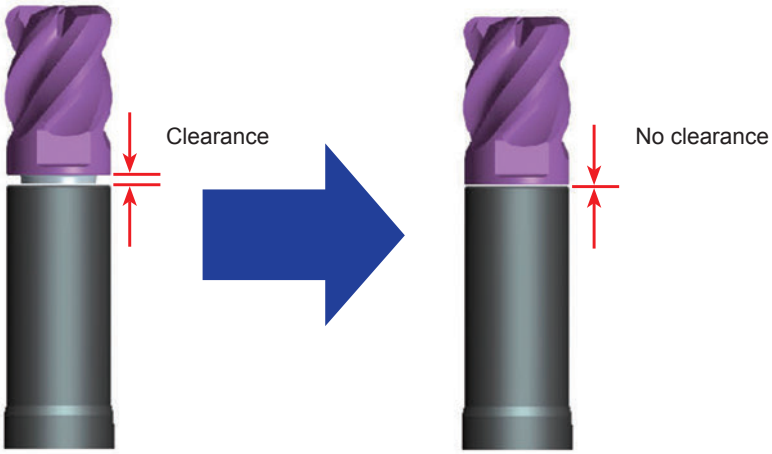
● : **Inventory maintained in Japan.**

HOW TO INSTALL THE HEAD

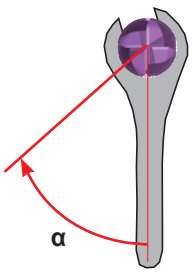
- Before installing remove all the dust and oil etc. Remove also the anti-rust oil from a new head.
  Coat only the screw part of the head with a small amount of anti-seize compound. If too much compound is used, during tightening, the anti-seize compound may enter the taper part and have a large effect on the coupling mechanism. Wipe off the anti-seize compound and make adjustments.
  Be careful that there is no anti-seize compound sticking inside the taper when inserting the head into the holder.



- Be careful because you may cut your hand if you touch the edge of the blade directly when tightening.
  There is still a clearance in this state, use the accessory wrench to tighten until the face of the head and holder fit snugly together.
- Refer to the table below for the necessary recommended torque angle.
  If regulating more strictly, use the torque wrench to tighten by the recommended torque below.



Fastening size	Reference tightening angle α	Recommended clamping torque (Nm)
iMX10	50°	10
iMX12	50°	15
iMX16	50°	30
iMX20	40°	50
iMX25	35°	75

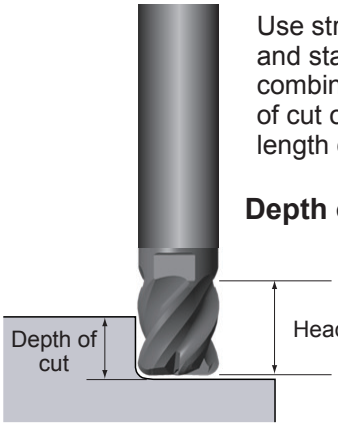


Note 1) Do not handle cutting edges with bare hands.
Note 2) Please use the wrench provided. It is thinner than a standard wrench to prevent damage to the flutes when tightening.

iMX holder application

- Combination of the straight type and standard head causes interference when the depth of cut is head length or more. (Because holder diameter = head diameter)
- Combination of the straight type and offset head may make the depth of cutting length or more. (Because holder diameter < head diameter)

Straight + Standard head

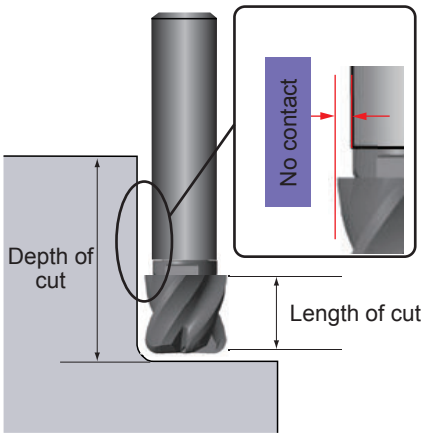


Use straight type and standard head combination at a depth of cut of the head length or less.

Depth of cut < Head length

Installation at an overhang of 3D or less is also possible, if the depth of cut < head length is assumed.

Straight + Offset head



- It is suitable for vertical wall machining, because the undercut type has a relief neck.
- A taper neck with thick relief has high rigidity. Especially a stable cutting is demonstrated at deeper machining.
- Perform straight shank additional grinding together with customer application for undercut taper neck type. (Refer to the cutting edge diameter (BD) of each type for the minimum machining diameter.)

COATED CARBIDE(CVD&PVD)

<CVD>

- Special tough fibrous structure improves wear and fracture resistance.
- It covers a wide application range and reduces the number of tools required.

<PVD>

- PVD coating prolongs tool life when compared to cemented carbide under the same cutting conditions.
- Coating of tools with sharp edges is possible without softening or changing the quality of the subsrate.

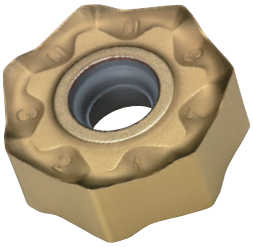
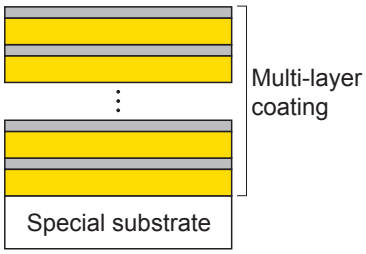
For machining of stainless steel

MP7030



MP7030 has a multi-layer coating based on newly developed Ti-compound. It provides superior wear and fracture resistance in stainless steel machining. A special tough cemented carbide substrate gives excellent performance in machining of difficult-to-cut materials such as stainless steel.



Heat-resistant Alloy, Cutting For Titanium Alloy

MP9130

An enhanced super fine cemented carbide substrate has increased toughness while maintaining hardness.
The Al-Ti-Cr-N accumulating coating ensures optimum heat and wear resistance. The combination of these properties gives excellent fracture resistance and welding resistance because of low coefficient of friction when machining titanium alloy.

CERMET

- NX2525 for high speed milling.
- NX4545, MX3030 for general milling.

CBN(SINTERED CBN)

- MB710 and MB730 for cast iron cutting.
- BC5030 for high speed machining of cast irons now available.
- Due to the combination of the BC5030 insert geometry and the AOX allows the use of up to 16 corners per insert, enabling cost effective high efficiency machining.

SELECTION STANDARD / RECOMMENDED CUTTING CONDITIONS

FINISHING

Work Material		Structure	Cutting Speed (m/min) 250 500 750 1000 1250	Feed (mm/tooth)	Depth of Cut (mm)	Coolant
Grey Cast Iron	JIS FC250	Ferritic + Pearilitic	MB710 / MB730	−0.3	−0.5	Dry
	JIS FC300	Pearilitic				

ROUGHING

Work Material		Structure	Cutting Speed (m/min) 250 500 1000 1500 2000	Feed (mm/tooth)	Depth of Cut (mm)	Coolant
Grey Cast Iron	JIS FC250	Pearilitic	BC5030	−0.15	−3.0	Dry

FEATURES AND BASE

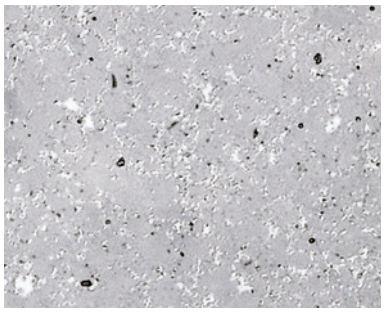
Grade	Application	Features	Main Component	Coating Layer
MB710	For General Cutting	General purpose grade with well balanced wear and fracture resistance.	CBN TiC Al_2O_3	–
MB730	For High Speed Cutting For interrupted Cutting	Has the largest CBN content and therefore displays good thermal conductivity. It is suitable for the high temperatures that are generated in high speed cutting.	CBN (High Content) Co Base Alloy	–
BC5030	For high-speed machining at large depths of cut High-speed interrupted machining at large depths of cut	High CBN content and high thermal conductivity. The whole insert is composed of sintered CBN. This enables high speed, high efficiency machining at larger depths of cut. The coated grade for easy recognition of used corners.	CBN AlN	TiN

APPLICATION EXAMPLES

Tool		AOX445R10008D
Insert		SL-ONEN120404ASN (BC5030)
Machine		Machining Center
Workpiece		 JIS FC250
Cutting Condition	Cutting Speed (m/min)	1200
	Depth of Cut (mm)	2.8
	Width of Cut (mm)	70
	Table Feed (mm/min)	3057
	Feed per Tooth (mm/tooth)	0.1
Result		10 times longer tool life and 4 times higher efficiency than ceramics. Excellent machining with a surface finish of Ra < 1.6μm

Tool		NF10000R0408D (MB730)
Workpiece		 FC250
Component		Hydraulic component
Cutting Condition	Cutting Speed (m/min)	1800
	Feed per Tooth (mm/tooth)	0.1
	Table Feed (mm/min)	4584
	Depth of Cut (mm)	0.05
	Width of Cut (mm)	90
Coolant		Dry (Wet cutting at previous process)
Axial Runout (mm)		≤0.005mm
Result		Compared with competitor CBN grade cutting, the normal wear surface is excellent and a extendable life finishing is maintained.

PCD(SINTERED DIAMOND)



Micro-Structure of **MD220**

- **Suitable for non-ferrous metals cutting such as aluminium alloy.**
- **Suitable for extremely high speed finishing.**

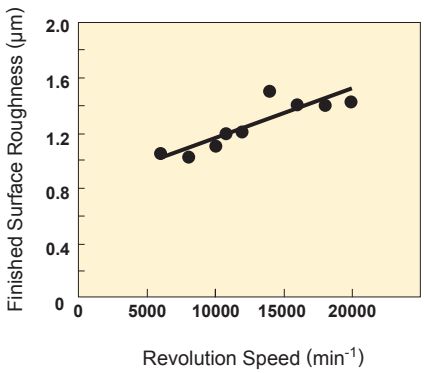
GRADE FEATURES

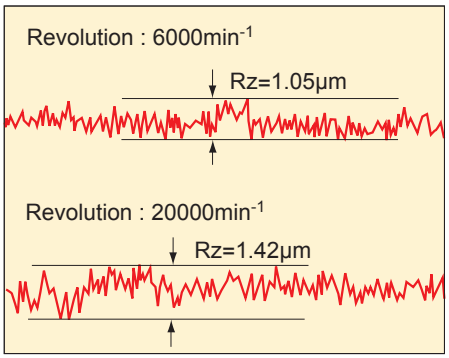
Grade	Features
MD220	Excellent in the balance between wear resistance and fracture resistance. For a wide range of tooling applications.

RECOMMENDED CUTTING CONDITIONS

Work Material	Cutting Speed (m/min)	Grade	Feed per Tooth (mm/tooth)	Depth of Cut (mm)
Aluminium Alloy (Si ≤12%)	1000—6000	**MD220**	—0.3	—0.5
Aluminium Alloy (Si ≥13%)	200—800			

CUTTING PERFORMANCE





<Cutting Conditions>
Workpiece : JIS A7075-T6
Insert : NP-GDCW1240PDFR2
Grade : MD220
Tool : V10000R0406D
Feed : 0.2mm/tooth
Depth of Cut : 0.5mm
Width of Cut : 80mm
Dry Cutting

Instructions for use of wiper inserts

Fig.1

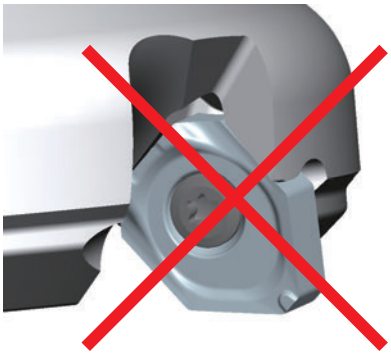

Fig.2

Wiper inserts for WSX445 are two-cornered. Please set as shown in Fig.1.
Excellent finished surfaces can be achieved with one wiper.
Set more than 2 wiper inserts, equally spaced, when the feed per revolution is larger than 8 mm/rev.

WSX445

* Refer to the table above and set the cutting conditions to match the application.
* Wet cutting is recommended, when focusing on the surface finish. (Life is lower than dry cutting.)

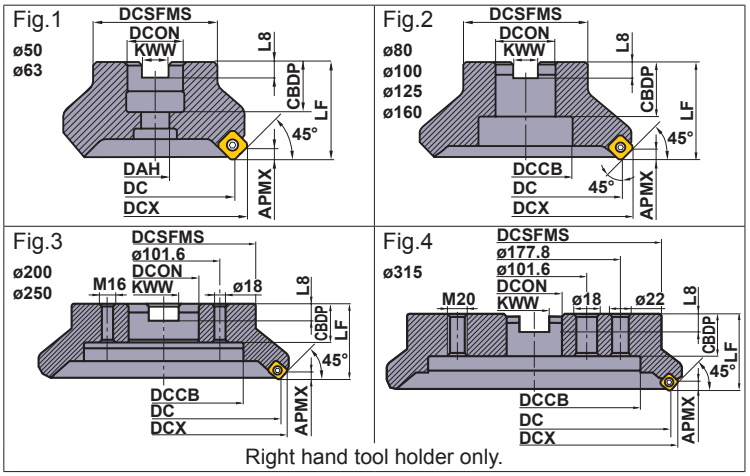
SYMBOL DESCRIPTIONS >> 1350
TECHNICAL DATA >> 1987
ISO13399 Property >> 1966

- Precision inexpensive moulded type 20°positive insert.
- Screw-on type.
- A wide range of chip breakers.
- High rigidity due to carbide shim.



Right hand tool holder only.

SPARE PARTS

Tool Holder Number	① Shim	② Shim Screw *	③ Clamp Screw *	Wrench (Insert)	Wrench (Shim)
ASX445	STASX445N	WCS503507H	TPS35	TIP15T	HKY35R

* Clamp Torque (N • m) : WCS503507H=5.0, TPS35=3.5

Wrench	1. Wrench: The ASX400 uses a TORXPLUS® clamp screw. The attached wrench is for the exclusive use of this screw. To ensure the effectiveness of TORXPLUS® only use the attached wrench. 2. Hexagonal wrench: The attached hexagonal wrench is for use with the seat and the shim. The wrench size is 3.5mm.
Spare Parts	Only use the original parts that were supplied when purchased. If other parts are used the performance and safety can not be assured.

Instructions for use of the JP breaker

* The JP breaker has sharp cutting edges.
  Wear gloves when handling.
* When machining aluminium alloy, welding to the cutting edge tends to occur, often leading to insert failure. To prevent this, wet cutting is recommended.

*Wiper inserts are single-cornered.
*CBN grade MB710 is for cast iron.
*PCD grade MD220 is for aluminum alloy.

Instructions for use of wiper inserts

Fig.1

Fig.2

- These wiper inserts are single-cornered.
- Install the insert so that the cutting edge is located as shown in Fig., 1.
  Do not install the wiper insert as shown in Fig. 2. (The insert may be damaged by a too heavy cutting load.)
- Recommended depth of cutting is ap=0.2-0.5(mm).
  (Be aware of the cutting load if the depth of cut is over the recommendation.)
- The major cutting edge of a wiper insert is set more inside than a general tooth.
  This is to prevent heavy loads on the wiper insert. (To prevent fracture set the feed under 0.2 mm/tooth)
- Excellent finished surface can be obtained with one wiper insert.
- When the feed per revolution is larger than the width of the wiper edge, install 2 or more wiper inserts equally inside the cutting body.

RECOMMENDED CUTTING CONDITIONS WHEN USING A WIPER INSERT

Work Material	Grade	Recommended Cutting Speed (m/min)
P	VP25N	200 (80—250)
	VP15TF	180 (80—250)
M	VP15TF	120—270
K	MC5020	130—250
	VP15TF	
S	VP15TF	20—50
H	VP15TF	40—80

●Recommended depth of cut (ap) is 0.2mm-0.5mm and feed per tooth (fz) is up to 0.2mm/t.

Instructions for Use of Wiper linserts

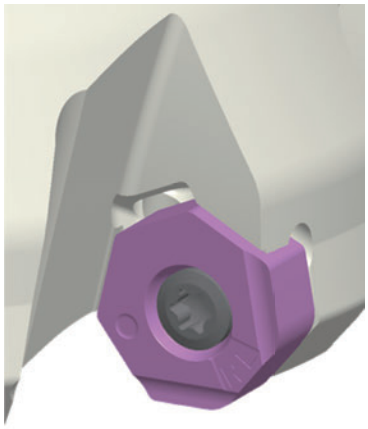

Fig.1

Fig.2

(Note 1) The specifications for these wipers are right hand body 2 corners and left hand body 2 corners. Refer to Figure 1.
(Note 2) A satisfactory finish surface can be achieved with one wiper insert.
However, if the feed rate per revolution will be equal to or greater than the width of the wiper edge, it is recommended to install the second and further wiper inserts spaced evenly within the cutting body.

(Note 1) Refer to the above table and set up cutting conditions according to cutting applications.
(Note 2) When placing emphasis on surface finish quality, wet cutting is recommended. (tool life is lowered as compared to dry cutting)
(Note 3) The recommended depth of cut differs according to insert geometry.
(Note 4) When clamp rigidity is low and tool overhang is long, we recommended to reduce the cutting speed and the feed rate by 30%.
(Note 5) Recommended wet cutting for good surface finishing of stainless steel. (Tool life is short compared to wet cutting.)

Instructions for Use of Wiper Iinserts

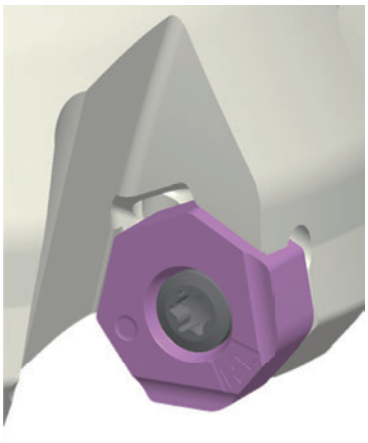

Fig.1

Fig.2

(Note 1) The specifications for these wipers are right hand body 2 corners and left hand body 2 corners. Refer to Figure 1.
(Note 2) A satisfactory finish surface can be achieved with one wiper insert.
However, if the feed rate per revolution will be equal to or greater than the width of the wiper edge, it is recommended to install the second and further wiper inserts spaced evenly within the cutting body.

(Note1) Recommended wet cutting for good surface finishing of stainless steel. (Tool life is short compared to wet cutting.)
(Note2) We recommend wet cutting with internal coolant for titanium alloy and heat resistant alloy.
(Note3) When clamp rigidity is low and tool overhang is long, we recommended to reduce the cutting speed and the feed rate by 30%.

		—	**MP9120**	**L**	60(50−70)	0.1(0.05−0.15)	≤3	≤0.6DC
		—	**MP9130**	**L**	40(20−50)	0.15(0.1−0.2)	≤3	≤0.6DC

(Note1) Recommended wet cutting for good surface finishing of stainless steel. (Tool life is short compared to wet cutting.)
(Note2) We recommend wet cutting with internal coolant for titanium alloy and heat resistant alloy.
(Note3) When clamp rigidity is low and tool overhang is long, we recommended to reduce the cutting speed and the feed rate by 30%.

Cutting Conditions with Wiper Insert

RECOMMENDED CUTTING CONDITIONS

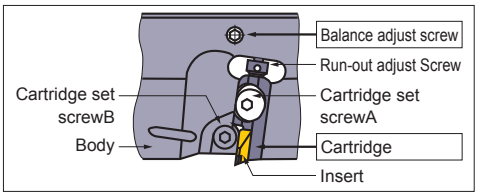
Work Material		Silicon (%)	Cutting Speed (m/min)	Feed per Tooth (mm/t.)	Depth of Cut (mm)
N	Aluminium Alloy	≤16	−6500	−0.2	−0.5
		≥16	−1000		

NOTE ON ROTATIONAL BALANCE

- At the time of shipping, the cutter body is balanced by using a special high accuracy master insert in order that it will conform to balance quality G6.3 based on ISO 1940/1 (approximate value at the maximum revolution for each cutter diameter). In order to keep good rotational balance, do not adjust the balance screw (HSS05005) located on the outer surface of the body.
- Rotational balance will change after exchanging cartridges. If you use the cutter at the same revolution as that of the following table or higher, re-balancing is necessary after exchanging cartridges. Please contact Mitsubishi Materials to re-balance the cutter.

(Note 1) If the revolution is the same as or lower than the value indicated above, the cutter can be used with a standard arbor. (Do not use long shank type arbors or special arbors, as the overhang could make it dangerous to use.)

(Note 2) If the revolution is higher than the value indicated above, please set the balance as follows : (Arbor + cutter)≤G6.3



Diameter of cutter (mm)	Revolution requiring re-balancing (min^{-1})
63	17000
80	14500
100	14000
125	Re-balancing not necessary up to the max. revolution

INSTRUCTIONS FOR USING INSERTS

Instructions for use of the JP breaker

- The JP breaker has sharp cutting edges. Wear gloves when handling.
- When machining aluminium alloy, welding to the cutting edge tends to occur, often leading to insert failure. To prevent this, wet cutting is recommended.

Instructions for use of wiper inserts

- Wiper inserts for the ASX400 are single-cornered.
- When installing the wiper insert, place the insert so that the small chamfer is located as shown.
- The peripheral cutting edge of the wiper insert is located back than general inserts. Beware of wear of the insert just behind the wiper insert.
- When using wiper set the following standard conditions. Depth of Cut (ap)≤0.5mm, Feed per Tooth (fz)≤0.2mm/t.

●φ16−φ100

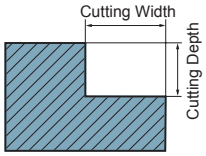
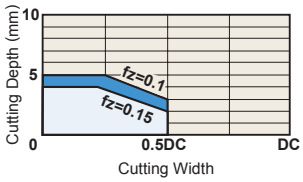
Cermet

Shoulder Milling

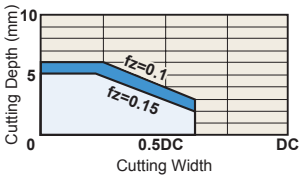


Workpiece : **JIS S50C**
Grade : **NX2525**

●φ10−φ14



●φ16−φ100



(Note 1) In each of the adove graphs cutting performance is shown for carbon steel (JIS S50C).
In case of alloy steels, reduce the conditions by 20−30%.
(Note 2) In the case of deep slot milling, air blow should be used.
(Note 3) The diameter "DC" is taken from the tools peripheral cutting edge.

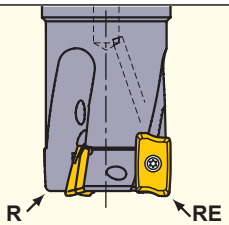
NOTE ON USE OF INSERTS WITH LARGE CORNER RADII

When using inserts with corner radius RE≥R2.4, please machine the holder with a radius form as shown on the right.



RE (mm)	R (mm)
2.4	1.9
3.0	2.5
3.2	2.7

R : Holder end radius
RE : Insert corner radius

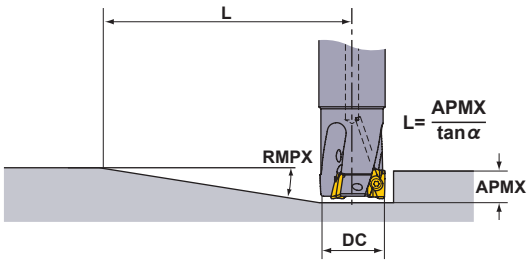
(Note 1) These cutting conditions are a guide to the standard shank type and the arbor type.
Please make adjustments according to the machining conditions.
(Note 2) Vibration is liable to occur in certain cases. Please reduce the depth of cut and / or reduce cutting conditions in the following cases.
- When using the long shank type and extra long shank type.
- When using long tool overhang with the standard or arbor type.
- When the application has poor clamping rigidity or when using a low rigidity machine.

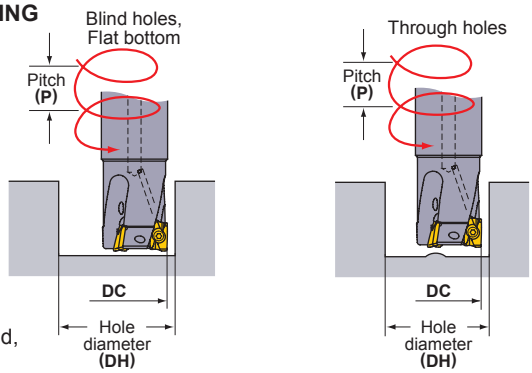
(Note 3) In case of coarse and fine pitch cutters, the coarse pitch type is recommended to prevent vibration.
(Note 4) For heavy interrupted and unstable cutting, the H breaker is first recommendation.

RAMPING/HELICAL CUTTING

RAMPING



HELICAL CUTTING



Refer to the table below for cutting conditions. For feed per tooth and cutting speed, follow the cutting conditions for slot milling.

Cutting Edge Diameter DC(mm)	Ramping: Maximum Ramping Angle RMPX	Ramping: Minimum Distance*1 L(mm)	Helical Cutting (Blind Hole, Flat Bottom): Maximum Hole Diameter*2 DH max.(mm)	Helical Cutting (Blind Hole, Flat Bottom): Maximum Pitch P max.(mm)	Helical Cutting (Blind Hole, Flat Bottom): Minimum Hole Diameter DH min.(mm)	Helical Cutting (Blind Hole, Flat Bottom): Maximum Pitch P max.(mm)	Helical Cutting (Through Hole): Minimum Hole Diameter DH min.(mm)	Helical Cutting (Through Hole): Maximum Pitch P max.(mm)

100	0.8°	716	198	1	196	1	189	1

(Note) When machining highly ductile materials with ramping angles above, chips could be continuous.
In this case, decrease the ramping angle or feed per tooth.
*1 L (=10 / tan α). Cutters' moving distance until depth of cut reaches 10mm at a maximum ramping angle.
*2 In case corner radius of 0.8mm. Other than that, find with the below formula.
{(cutting edge diameter DC)−(corner radius)−0.2)}×2

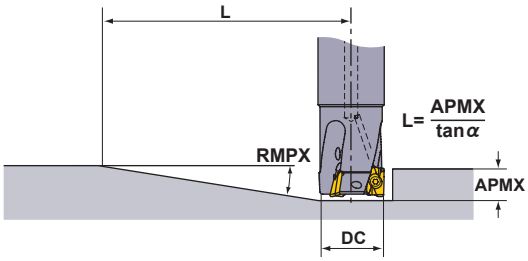
(Note 1) These cutting conditions are a guide to the standard shank type and the arbor type.
Please make adjustments according to the machining conditions.
(Note 2) Vibration is liable to occur in certain cases. Please reduce the depth of cut and / or reduce cutting conditions in the following cases.
- When using the long shank type and extra long shank type.
- When using long tool overhang with the standard or arbor type.
- When the application has poor clamping rigidity or when using a low rigidity machine.

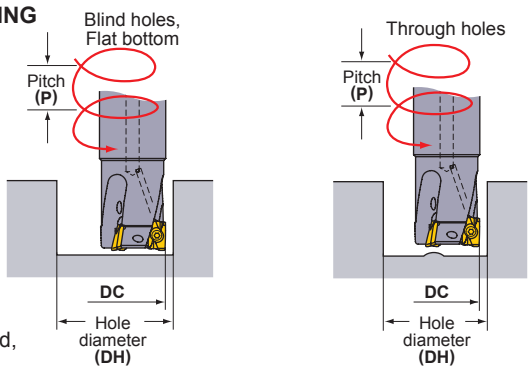
(Note 3) In case of coarse and fine pitch cutters, the coarse pitch type is recommended to prevent vibration.
(Note 4) For heavy interrupted and unstable cutting, the H breaker is first recommendation.

RAMPING/HELICAL CUTTING

RAMPING



HELICAL CUTTING



Refer to the table below for cutting conditions. For feed per tooth and cutting speed, follow the cutting conditions for slot milling.

Cutting Edge Diameter **DC** (mm)	Ramping: Maximum Ramping Angle **RMPX**	Ramping: Minimum Distance *1 **L** (mm)	Helical Cutting (Blind Hole, Flat Bottom): Maximum Hole Diameter *2 **DH max.** (mm)	Maximum Pitch **P max.** (mm)	Minimum Hole Diameter **DH min.** (mm)	Maximum Pitch **P max.** (mm)	Helical Cutting (Through Hole): Minimum Hole Diameter **DH min.** (mm)	Maximum Pitch **P max.** (mm)
25	11°	85	48	14	45	12	32	4
28	9°	105	54	12	51	11	38	4
32	7°	135	62	11	59	10	46	5
35	6°	158	68	10	65	9	52	5
40	6°	158	78	12	75	11	62	7
50	4°	238	98	10	95	9	82	7
63	3°	318	124	10	121	9	108	7
80	2°	477	158	8	155	8	142	6
100	1.5°	636	198	8	195	7	182	6
125	1°	954	248	6	245	6	232	5
160	1°	954	318	8	315	8	302	7

(Note) When machining highly ductile materials with ramping angles above, chips could be continuous.
In this case, decrease the ramping angle or feed per tooth.
*1 L (=15 / tan α). Cutters' moving distance until depth of cut reaches 15mm at a maximum ramping angle.
*2 In case corner radius of 0.8mm. Other than that, find with the below formula.
{(cutting edge diameter DC)−(corner radius)−0.2}×2

(Note 1) The maximum allowable spindle speeds are set to ensure tool and insert stability.
(Note 2) When using the tool at high spindle speeds, ensure that the tool and arbor are correctly balanced.
(Note 3) Note for inserts with a corner radius of 1.6 and above, as corner radius increases the LF dimension decrease.
*1 Clamp Torque (N • m) : TS3SB=1.5
*1 Use the clamp screw by setting the bundled screw.
*2 WT : Tool Weight

* Be careful because corner R(RE) has a different shape than machined workpiece R.
When a GM breaker is recommended, stress the dimensional precision of the workpiece shape.

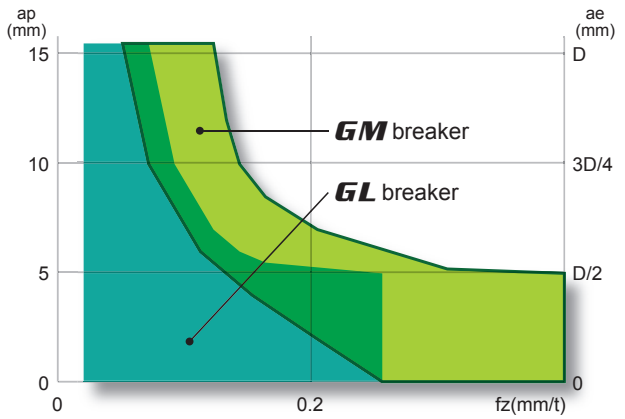
AXD4000

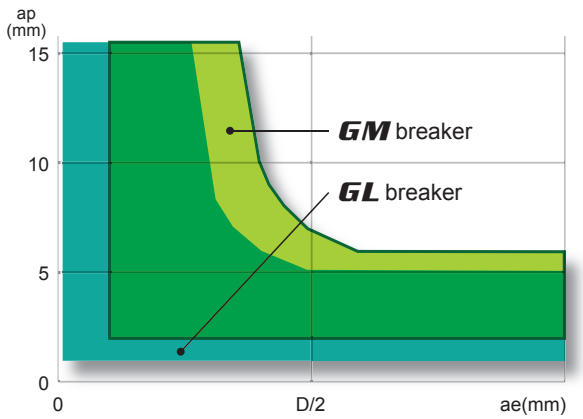
AXD4000 Selection of insert

It is necessary to choose the best insert according to the cutting conditions. Please select an insert from the tables below.
1st recommendation for stable cutting condition is the GL breaker with a strong cutting edge.

Selection of insert according to the feed per tooth and the required cutting depth

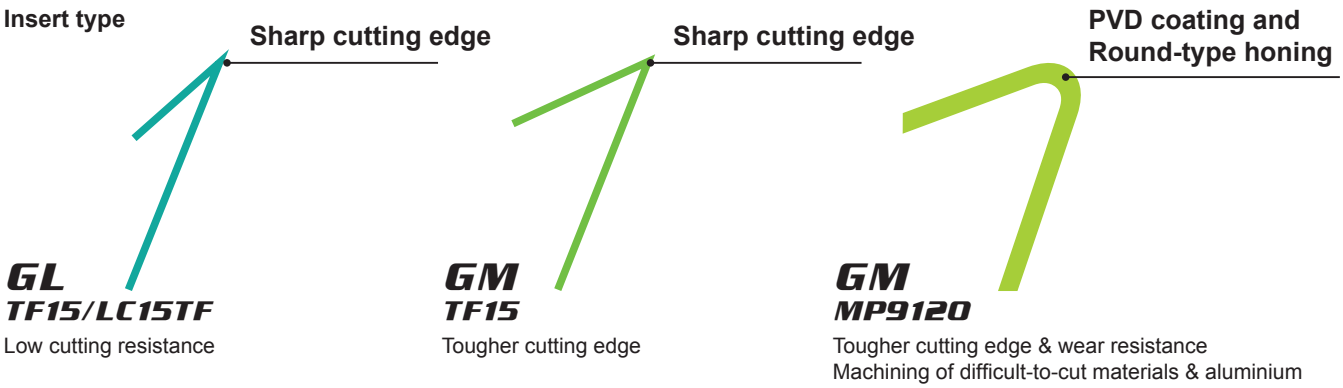


Selection of insert according to the width of cut and the required cutting depth

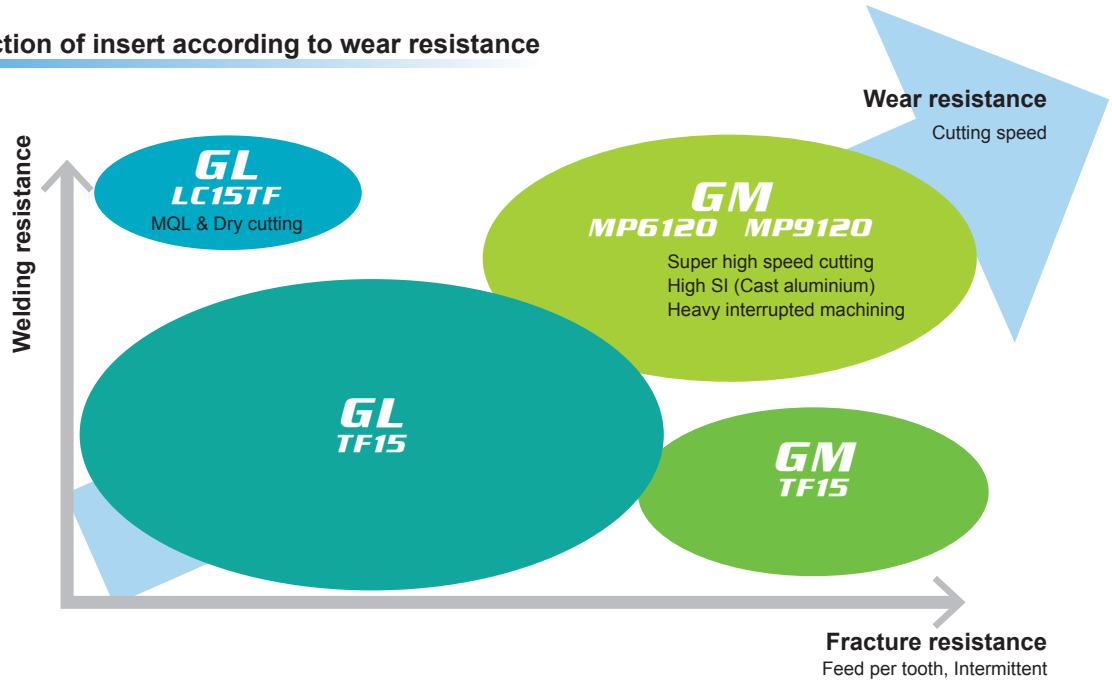


1st recommendation for machining aluminium alloys is GL breaker.
Under high-load conditions such as deep or high feed cutting, it is advisable to use the GM breaker.

Selection of insert according to cutting edge



Selection of insert according to wear resistance



AXD4000

(Note 1) The above cutting conditions are determined based on high workpiece and machine rigidity, where no vibration occurred.
If vibrations occur make adjustments according to the machining conditions.
(Note 2) Note, vibrations may occur in the following conditions.
- When using long tool overhang.
- When pocket machining corner radii.
- When the workpiece has poor clamping rigidity or when the machine rigidity or workpiece rigidity is low, vibrations can occur easily, if so, reduce cutting conditions such as width and depth of cut and feed per tooth.

(Note 1) The recommended ramping feed is 0.05mm/tooth or under.
*1) Using the maximum ramping angle, the distance to reach the maximum depth of cut is as follows:
L= (maximum depth of cut APMX/tan α). Maximum depth of cut A type is 15.5mm, B type is 14.8mm.
*2) Corner radius of 1.2mm. For other corner radii, use the following formula. {(cutting edge diameter DC)–(corner radius RE)–0.25}×2
*3) Corner radius of 2.4mm. For other corner radii, use the following formula. {(cutting edge diameter DC)–(corner radius RE)–0.25}×2
*4) Corner radius of 3.2mm. For other corner radii, use the following formula. {(cutting edge diameter DC)–(corner radius RE)–0.25}×2

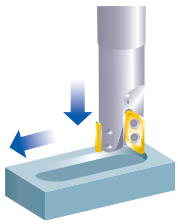
AXD4000 can be effectively used for pocket machining without the need for a prepared hole.



AXD7000

For Aluminium Alloy

Product Information

90° KAPR

Work Material

P N S F R

SYMBOL DESCRIPTIONS >> 1350
TECHNICAL DATA >> 1987
ISO13399 Property >> 1966

- Low resistance chipbreaker.
- Low resistance insert and high rigidity design for excellent performance.
- For high-speed machining.
- Multi-functional machining.

(Note 1) The above cutting conditions are determined based on high workpiece and machine rigidity, where no vibration occurred.
If vibrations occur make adjustments according to the machining conditions.

(Note 2) Note, vibrations may occur in the following conditions.
- When using long tool overhang.
- When pocket machining corner radii.
- When the workpiece has poor clamping rigidity or when the machine rigidity or workpiece rigidity is low, vibrations can occur easily, if so, reduce cutting conditions such as width and depth of cut and feed per tooth.

(Note 1) The above cutting conditions are determined based on high workpiece and machine rigidity, where no vibration occurred.
If vibrations occur make adjustments according to the machining conditions.
(Note 2) Note, vibrations may occur in the following conditions.
- When using long tool overhang.
- When pocket machining corner radii.
- When the workpiece has poor clamping rigidity or when the machine rigidity or workpiece rigidity is low, vibrations can occur easily, if so, reduce cutting conditions such as width and depth of cut and feed per tooth.

AXD7000

CAUTION FOR USE

Procedure for attaching inserts

1) Clean the seat by air blowing or with a brush before installing the insert.
2) Tighten the clamp screw using the accessory wrench while pressing the insert against the seat.
3) Tighten the clamp screw as shown in Figure 1.
4) Coat the clamp screw with anti-seize compound and tighten it to the specified tightening torque.
   The tightening torque is shown below.
   AXD7000 3.5N•m(2.58ft•lb)
   AXD4000 1.5N•m(1.11ft•lb)
5) The clamp screw is an important part in ensuring safety.
   Purchase an official product from Mitsubishi Materials.
   When using over the revolution shown in Table 2, replacing the clamp screw simultaneously with insert replacement is recommended.

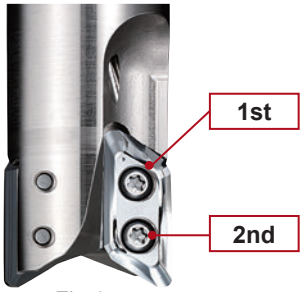

Fig.1

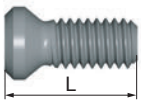
Type	AXD4000		AXD7000	
Cutting Edge Diameter **DC**(mm)	ø20	ø25−ø125	ø32	ø40−ø125
Clamp Screw Number	TS3SBS	TS3SB	TS4SB	TS4SBL
Overall Length **L**(mm)	6.5	8	9	10.5



6) Check that there is no clearance at the insert seat surface.

Installation of arbor type

1) Clean carefully the inside and face of the hole and the arbor face before installing the body to the arbor.
2) Set the body at the arbor and tighten it with the accessory. Refer to the table shown below for the tightening torque.
3) The set bolt supplied with the AXD is a special coolant through compatible nozzle. Be careful not to lose it.

AXD7000

Cutting Edge Diameter **DC**(mm)	ø32	ø40	ø50	ø63	ø80	ø100	ø125
Max. Allowable Revolution (min^{-1})	41000	36000	30000	25000	23000	19000	16000

● Even when operating under the maximum allowable spindle speed, if the spindle speed is equal to or higher than the values shown in table 2, it is recommended that the balance quality (with the arbor or milling chuck) conforms to G6.3 or betterbased on ISO1940. It is also recommended to replace the clamp screws with new ones when changing inserts. Furthermore,ensure to use machines that are provided with safety measures in case of cutter breakage.

(Note) The balance quality of the holder (without inserts and clamp screws) is G6.3 or better at 10,000min^{-1}.

Table 2 Maximum spindle speed when balancing with the arbor or milling chuck has not been achieved

AXD4000

AXD7000

Cutting Edge Diameter **DC**(mm)	ø32	ø40	ø50	ø63	ø80	ø100	ø125
Max. Allowable Revolution (min^{-1})	9500	7600	6000	4800	3800	3000	2400

● When setting the spindle speed, take into consideration the maximum allowable spindle speed of the arbor or milling chuck.
● Use the specified set bolt when using the arbor type with through coolant.
● The inserts have sharp cutting edges and handling them with bare hands may cause injuries.
Always wear safety gloves whenhandling the indexable inserts.

BXD4000

Aluminium Alloy to Difficult-to-cut Material Cutting

Product Information

90° KAPR

Work Material

P M K N S H F R

SYMBOL DESCRIPTIONS >> 1350
TECHNICAL DATA >> 1987
ISO13399 Property >> 1966

- Curved cutting edge and high rigidity holder produce high wall accuracy.
- Low resistance insert and high rigidity design for excellent performance.
- With through coolant holes to ensure smooth chip discharge.
- For high-speed machining.

(Note 1) The maximum allowable revolutions are set to ensure tool and insert stability.
(Note 2) When using the tool at high spindle speeds, ensure that the tool and arbor are correctly balanced.
*1 Clamp Torque (N • m) : TS4SL=4.0 *2 RMPX : Max. Ramping Angle *3 WT : Tool Weight

CAUTION FOR USE

- Only use the inserts and parts provided by Mitsubishi Materials with this tool. Use of the correct insert clamp screws is especially important to ensure overall tool safety. Do not use damaged or worn clamp screws.
- The maximum allowable spindle speeds are shown in Table 1. Ensure that the cutter operates under the maximum allowable spindle speed. The maximum allowable spindle speeds for safety purposes are determined in accordance with ISO15641 (Milling Cutters for high speed machining–Safety requirements).

Table 1 Max. Allowable Revolution

Cutting Edge Diameter DC(mm)	ø20	ø25	ø28	ø32	ø35	ø40	ø50	ø63	ø80	ø100	ø125
Max. Allowable Revolution (min-1)	15000*	38000	35000	33000	31000	29000	24000	21000	19000	16000	14000

* ϕ20mm with one tooth balancing is necessary to adjust sensitively.

- Even when operating under the maximum allowable spindle speed, if the spindle speed is equal to or higher than the values shown in table 2, it is recommended that the balance quality (with the arbor or milling chuck) conforms to G40 or betterbased on ISO1940. It is also recommended to replace the clamp screws with new ones when changing inserts. Furthermore,ensure to use machines that are provided with safety measures in case of cutter breakage.

Table 2 Maximum spindle speed when balancing with the arbor or milling chuck has not been achieved

Cutting Edge Diameter DC(mm)	ø20	ø25	ø28	ø32	ø35	ø40	ø50	ø63	ø80	ø100	ø125
Max. Allowable Revolution (min-1)	15000	12000	10800	9500	8700	7600	6000	4800	3800	3000	2400

- When setting the spindle speed, take into consideration the maximum allowable spindle speed of the arbor or milling chuck.
- Use the specified set bolt when using the arbor type with through coolant.
- The inserts have sharp cutting edges and handling them with bare hands may cause injuries. Always wear safety gloves whenhandling the indexable inserts.

		280—350HB	**VP15TF**	140 (120—160)	0.15 (0.1—0.2)
M	Stainless Steel	≤270HB	**VP15TF**	140 (120—160)	0.2 (0.1—0.3)
N	Aluminium Alloy	—	**LC15TF TF15**	1000 (200—3000)	0.3 (0.1—0.5)
S	Ti Alloy	—	**VP15TF**	40 (30—60)	0.1 (0.1—0.3)
	Heat Resistance Alloy (Inconel etc.)	—	**VP15TF**	30 (20—40)	0.15 (0.1—0.2)
H	Hardened Steel	40—60HRC	**VP15TF**	70 (50—100)	0.1 (0.05—0.15)

●Figures above are a guide lines for optimum general use. They may vary depending on machine rigidity, work clamping and length of tool overhang.
●When using ϕ20 shank type, set the table feed at under 0.05mm/t. and maintain observation during cutting.
●Please adjust the table feed when using long- and extra-long-shank types.
●Please adjust the table feed when ramp machining (Recommended feed:0.05 mm/t. under).

RECOMMENDED CUTTING CONDITIONS

CUTTING SPEED

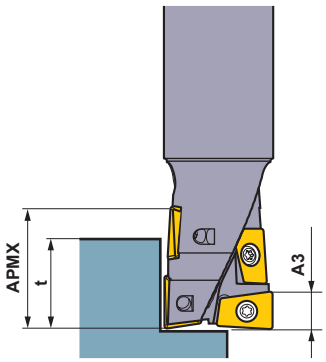
vc = m/min

Work Material	No.	Hardness	Breaker	Cutting Speed for Different Grades **vc** (m/min)		
P				**MP6120**	**VP15TF**	**MP6130**
Mild Steel (ASTM A36, AISI 1010 etc.)	1	≤180HB	**M2**	200 (170—240)	180 (150—220)	160 (130—200)
Carbon Steel Alloy Steel (AISI 1045, AISI 4140 etc.)	2	180—350HB	**M2**	180 (140—220)	160 (120—200)	140 (100—180)
M				**MP7130**	**MP7140**	**VP30RT (VP15TF)**
Austenitic Stainless Steel (AISI 304, AISI 316 etc.)	1	≤200HB	**M2**	170 (120—200)	160 (100—180)	150 (120—180)
Austenitic Stainless Steel (AISI 304LN, AISI 316LN etc.)	2	>200HB	**M2**			
Ferritic and Martensitic Stainless Steel (AISI 410, AISI 430 etc.)	3	≤200HB	**M2**			
Ferritic and Martensitic Stainless Steel (AISI 431, AISI 420 etc.)	4	>200HB	**M2**			
K				**VP15TF**		
Gray Cast Iron (AISI No45B etc.)	1	≤350MPa	**M2**	180 (150—220)	—	—
Ductile Cast Iron (FCD450 etc.)	2	≤450MPa	**M2**	180 (150—220)	—	—
N				**HTi10**		
Aluminum Alloy (A6061, A7075 etc.)	1	Si<5%	**G1**	500 (200—800)	—	—
Aluminum Alloy (AC4B etc.)	2	5%≤Si≤10%	**G1**	100 (50—300)	—	—
Aluminum Alloy (ADC12, A390 etc.)	3	Si>5%	**G1**	100 (50—300)	—	—
S				**MP9120**		
Titanium Alloy (Ti-6Al-4V etc.)	1	—	**M2**	50 (30—70)	—	—
H				**VP15TF**		
Hardened Steel (AISI H13, AISI L6 etc.)	1	40—55HRC	**M2**	80 (50—120)	—	—

* Wet cutting is recommended for Titanium alloy.

AQX

RECOMMENDED CUTTING CONDITIONS

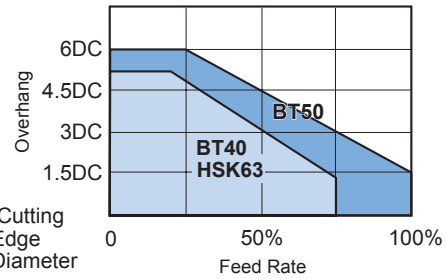


∗ Figures for A3 and APMX are shown in the standard holder tables on the previous pages.

- A3 is the depth of cut for the full dual insert portion at the end of the cutting edge.
- Beyond the range of A3 where overlapping occurs, there is an area where the cutting edge becomes a single insert, not forming full dual insert configuration. As such, please pay special attention to the relationship between depth of cut and feed.
- In general, the edge at the border of cut tends to suffer from damages. At large depth of cut operations, applying the following depth of cut (t), at which the edge is full dual insert at the border of cut, is recommended to prevent damage to the cutting edge.

(mm)

Tool diameter	Recommended depth of cut t (mm)
ϕ16,17	12 – 14
ϕ20,21	14 – 17
ϕ25,26	17 – 22
ϕ32,33	22 – 28
ϕ35	25 – 32
ϕ40	28 – 35
ϕ50	35 – 45



- Chatter vibration and other problems tend to occur at operations where overhang length is large and/or machine rigidity is low, resulting in unstable machining.
- Please reduce feed accordingly, using the above chart as a guideline.

AQX

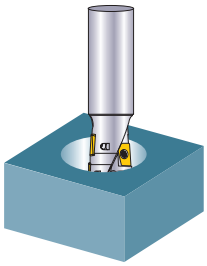
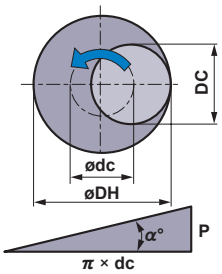
RECOMMENDED CUTTING CONDITIONS

FOR HELICAL CUTTING





- How to derive a locus of the center of the tool.
- Depth of cut for each pass.

$$\text{Ø dc} = \text{Ø DH} - \text{DC}$$

Locus of the center of the tool — Desired hole diameter — Cutting edge diameter

$$P = \pi \times dc \times \tan \alpha°$$

(Note) $\alpha° \leq 3°$

- Min. machined hole diameter for helical cutting : 1.2DC
  Max. machined hole diameter for helical cutting : 1.8DC
- For efficient chip discharge, always apply air blow.
- When using a G1 breaker insert (VP15TF), please reduce the feed rate by 20%.

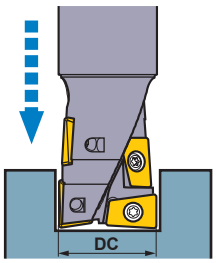
(Note) Helical grooving is strongly recommended for machining tempered steel.
*1 When using G1 breaker (VP15TF), please reduce the feed rate by 20%.
*2 For more information on "No.", please refer to cutting speed.

AQX

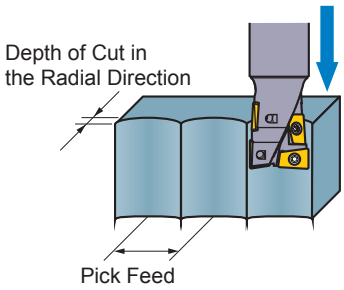
FOR DRILLING AND PLUNGING

Drilling



- The recommended drilling depth is less than 0.5DC.
- Use step feed when drilling (0.25−0.5mm) to ensure that the chips are effectively broken.
- Use internal or external cooling to ensure that the chip disposal is sufficiently achieved.
- The chips generated can dispel in any direction, so ensure that adequate safety precautions are taken.

Plunging



- The feed for plunging is the same as the feed for drilling.
- No step feed necessary.
- Please refer to the following table for the depth of cut at plunging operations.

Depth of Cut in the Radial Direction	≤ 0.4DC
Pick Feed	≤ 0.5DC

(mm)

	Work Material	No.	Hardness	ϕ16, 17		ϕ20, 21		ϕ25, 26		ϕ32, 33, 35		ϕ40		ϕ50

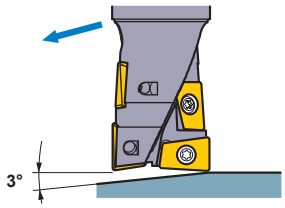
(Note) Helical grooving is strongly recommended for machining tempered steel.
*1 When using G1 breaker (VP15TF), please reduce the feed rate by 20%.
*2 For more information on "No.", please refer to cutting speed.

FOR RAMPING



- When machining steel the recommended ramping angle is 3°. If a ramping angle larger than 3° is used, then the chips may not be broken effectively resulting in chips wrapping around the tool.
- During ramping, it is recommended to reduce the feed rate by 40% from the cutting conditions.

Product Information

Work Material

P M K S H

SYMBOL DESCRIPTIONS >> 1350
TECHNICAL DATA >> 1987
ISO13399 Property >> 1966

- 13° and 15° positive inserts.
- High rigidity double clamp structure.
- Suitable for high feed machining.
- With through coolant holes.
- Special insert design with 3 cutting edges.

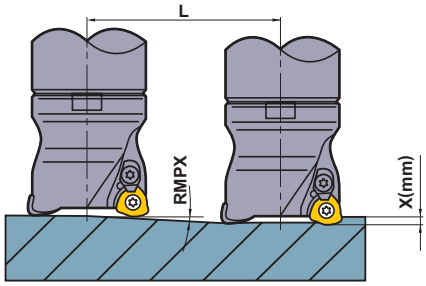
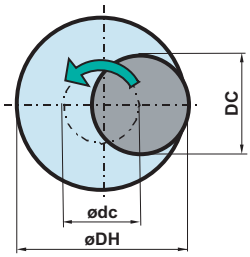
MAXIMUM CAPACITIES BY MODE

RAMPING



HELICAL DRILLING



- How to derive a locus of the center of the tool.

ødc = øDH - DC

Locus of the center of the tool — Desired hole diameter — Tool Diameter

- The depth of cut per pass must not exceed the max. depth of cut APMX.
- Set the machine spindle revolution so that the tool is rotating and cutting in a down cut direction.

- When ramping and helical cutting, please apply a lower feed (60% of the calculated feed rate or less).
- When drilling, please set the feed in the axial direction at 0.2mm/rev or less.
- The long chips generated can disperse, ensure that adequate safety precautions are taken.

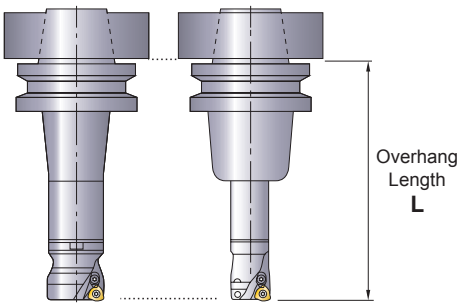
① Overhang Length **L**



② Main Spindle Revolution
n(min^{-1})=(Recommended Cutting Speed x 1000)÷(Outer Tool Diameter x 3.14)

③ Table Feed Rate
vf(mm/min)=n x Feed per Tooth x Number of Teeth

④ Recommended width of cut (ae) is more than 60% of the cutting edge diameter.

⑤ The above cutting conditions are guides to cutting on a #50 BT machine. In case of #40 BT and #63 HSK machines, a cutting edge diameter of under 35mm is recommended. In this case, reduce the depth of cut and table feed rate.

⑥ Use of ST chipbreaker with tougher cutting edges is recommended for machining parts that require interrupted cutting. First recommended insert grade for non-standard 06/08/09 ST chipbreakers is VP30RT irrespective of the workpiece material.

⑦ Cutter body with coarse pitch is recommended for the unstable cutting caused by the long tool overhang.

⑧ Use the "sharp" JM chipbreaker to lower cutting forces or when long tool overhangs are used.

⑨ Heavy chips are generated when machining with the AJX. To avoid chip jamming-related problems, use air blow while machining to discharging chips effectively.

⑩ The JL breaker depth of cut ap differs depending on the insert.
06 size is up to 0.6mm, 08 size is up to 0.9mm, and 09,12,14 size is up to 1.2mm.

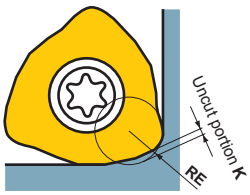
NOTE FOR PROGRAMMING



When using the AJX, please programme as an R3 radius cutter. The approximate uncut portions for the programme are as follows.

Insert size	Breaker	Approx. RE(mm)	Uncut portion K(mm)
06	FT / JM	2.0	0.33
	JL	2.5	0.32
08	FT / JM	2.5	0.46
	JL	2.0	0.40
09	FT / JM	3.0	0.47
	JL	3.0	0.46
12	FT / JM / ST	3.0	0.63
	JL	3.0	0.53
14	FT / JM / ST	3.0	0.64
	JL	3.0	0.55

(Note.) The uncut portion may change slightly depending on cutting conditions.

			VP15TF	150 (100—200)	C,E,F	0.1 (0.05—0.15)
					D,G,H,I	0.075 (0.05—0.1)

●Revolution (min^{-1})=(1000 x Cutting Speed)÷(3.14 x DC)
●Table Feed (mm/min)=Feed per Tooth x Number of Teeth x Cutter Revolution
(Note 1) This list of recommended cutting conditions is for flank wear of 0.3mm in 30 min. cutting time.
(Note 2) More than 50mm shank length should be clamped in the milling chuck.
(Note 3) Use step cutting when driling (0.5 mm steps are recommended).
(Note 4) When chattering occurs, reduce cutting speed by 20—30 %.
(Note 5) When using round inserts, make sure that the flat portion of the flank surface is secure against the insert seat wall.

S	Titanium Alloy	–	**MP9130**	45 (30–55)	0.1 (0.05–0.15)
	Heat Resistant Alloy	–	**MP9130**	35 (15–45)	0.1 (0.05–0.15)

* Actual cutting conditions are estimated to avoid chatter vibration with high rigidity of a machine or workpiece.
  Make appropriate adjustments when chatter and/or insert chipping occurs during cutting.
  Use with lowered conditions when there is a big overhang and/or when pocket-cutting.
* The setting level for feeding 1 blade is ap = 2.5mm with ARP5 axial cutting. With ARP6, use ap = 3mm.
  Use while matching the ap fluctuation and correction value F of the respective table.
  Ex. Feed for the recommended 1 blade when ARP5,SUS304, MP7130,ap=1: 0.2 mm/t.×1.5 (correction value F)=0.3 mm/t.
* For grooving, use feed at the recommended 70% level. For ramping, drilling, and plunging, use 50% level.
* Internal coolant is recommended in titanium alloy and heat resistant alloy cutting.
  When the coolant nozzle of separately sold is used, it is more effective.

* When drilling, be careful of long scattered cutting chips
* When cutting helical holes, do not exceed the largest APMX cutting depth per one rotation.
* Calculate using the following formula for center tool tracks and ϕdc when cutting helical holes: Center tool tracks ϕdc=desired hole diameter ϕDH tool diameter ϕDCX
* For preventing trouble with cutting chip biting, especially when grooving, ramping, helical cutting, and drilling, thoroughly eliminate cutting chips with an air blower or the like.
* Cutting chip pockets are small for extra-multiple cutting and small diameter cutters.
  Use with caution the ae and ap feed due to the possibility of cutting blockage.
* When cutting large ae with large diameter cutter, blockage from long cuttings is possible.
  Regulate ap and feed.

Correction level F feed amount for 1 blade, based on axial cutting ap fluctuation

Holder	ap=0.5mm	ap=1mm	ap=1.5mm	ap=2mm	ap=2.5mm	ap=3mm	ap=3.5mm	ap=4mm	ap=5mm	ap=6mm
ARP5	2.3	1.5	1.2	1.1	1.0	0.9	0.8	0.8	0.8	–
ARP6	2.5	1.7	1.3	1.1	1.0	1.0	0.9	0.9	0.8	0.8

* Tool body durability may weaken, when the amount of axial cutting exceeds ARP5=5mm and ARP6=6mm.

ARX

RECOMMENDED CUTTING CONDITIONS

* The cutting conditions below are a guide only.Please make adjustments according to the machining conditions.
* Please note the follows when machining the hardened steel by using MP8010.
  - Please shorten the overhang length as much as possible.
  - Use with carbide shank recommended.
  - Please note the setting of the depth of cut especially to prevent the fracture.
  - The first recommended grade when machining hardened steel of less than 50HRC is VP15TF.

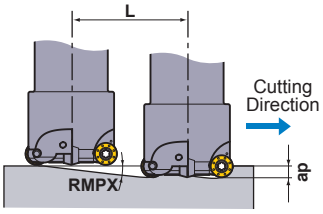
ARX

CUTTING MODE MAXIMUM CAPACITIES

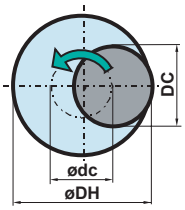
RAMPING

Finding a cutters' distance moved **"L"** when depth of cut reaches **"ap"** at a ramping angle of **"α°"**.

L=ap/tan α (mm)



HELICAL DRILLING



- How to derive a locus of the center of the tool.

ødc = øDH - DC

Locus of the center of the tool — Desired hole diameter — Cutting edge diameter

- For the depth of cut per cycle, refer to the cutting conditions for helical drilling.
- Set the machine spindle revolution so that the tool is rotating and cutting in a down cut direction.

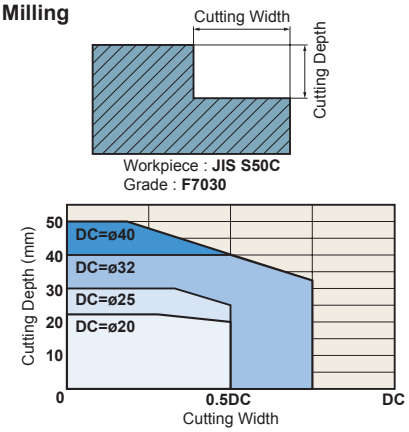
- Revolution (min^{-1})=(1000 x Cutting Speed)÷(3.14 x DC)
- Table Feed (mm/min)=Feed per Tooth x Number of Teeth x Cutter Revolution

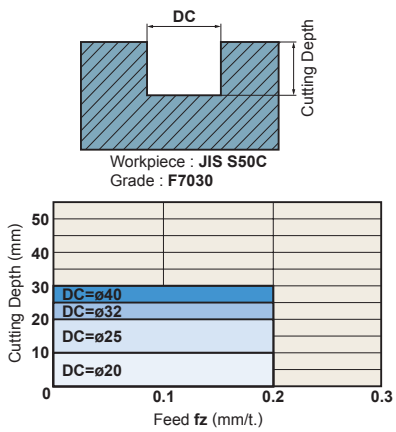
CUTTING PERFORMANCE

Cemented carbide/Coated carbide

Shoulder Milling



Slot Milling



(Note 1) In each of the adove graphs cutting performance is shown for carbon steel (JIS S50C).
In case of alloy steels, reduce the conditions by 20—30%.
(Note 2) In the case of deep slot milling, air blow should be used.
(Note 3) The diameter "DC" is taken from the tools peripheral cutting edge.

DEEP SHOULDER MILLING

Product Information

90° KAPR

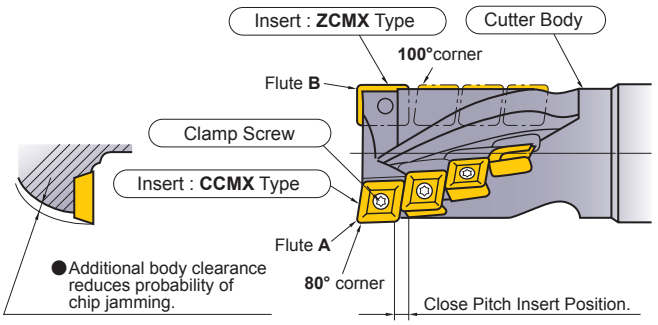
SYMBOL DESCRIPTIONS >> 1350
TECHNICAL DATA >> 1987
ISO13399 Property >> 1966

Work Material

P M K R

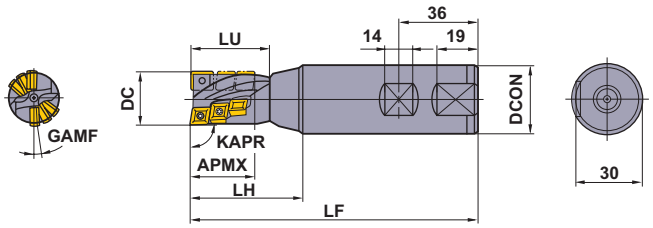
- Different helical flute angles prevents chattering.
- Suitable for heavy cutting due to holder rigidity.

DESIGN FEATURES OF DCCC TYPE END MILL

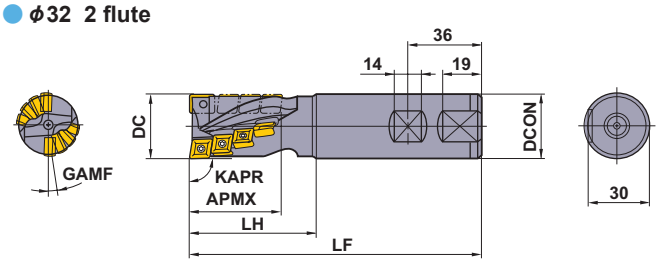


●All 4 cutting edges of CCMX insert are utilized, 80° corners in flute "A" and 100° corners on flute "B".

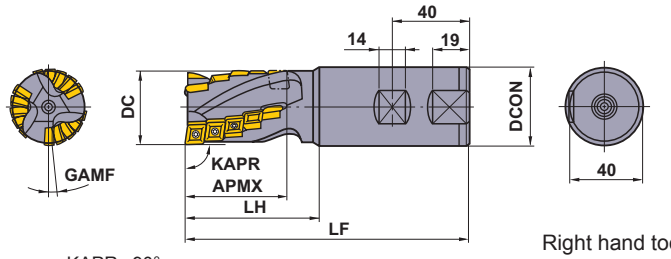
ϕ25 2 flute



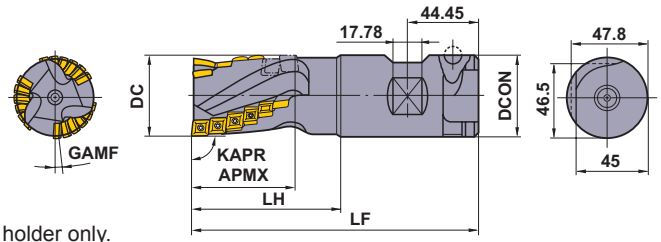
ϕ32 2 flute



ϕ40 3 flute



ϕ50 (Combination Shank) 3 flute



KAPR : 90°

Right hand tool holder only.

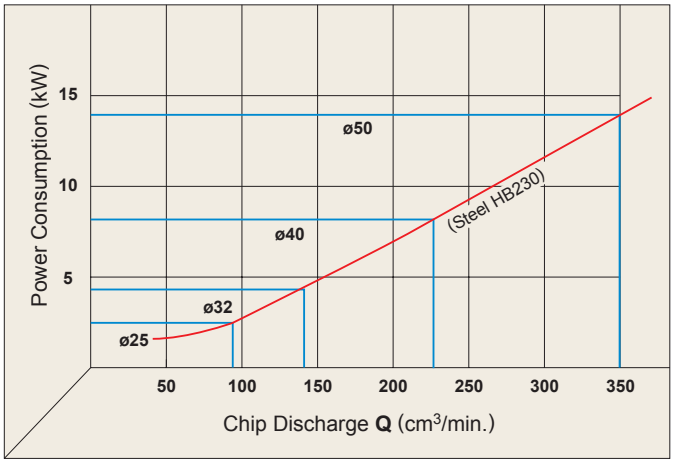
- Revolution (min^{-1})=(1000 x Cutting Speed)÷(3.14 x DC)
- Table Feed (mm/min)=Feed per Tooth x Number of Teeth x Cutter Revolution

POWER CONSUMPTION

- Please use the chart below for reference, please select the conditions that suits the machines power.
- Chip Discharge Q (cm^3/min.)=Table Feed x Depth of Cut x Cutting Width÷1000



FOR USE OF APMX LONG TYPE

- Since the overhang from the milling chuck is long, a large width of cut will cause chattering and tool breakage.
- Keep the width of cut small and the depth of cut in axial direction large. (See the following illustration.)
- For slot milling, keep the table feed at not more than half the value listed in the above table. (Use the APMX Short type as much as possible.)

(Note 1) The above cutting conditons are determined based on high rigidity machine and workpiece, where no vibration occurred. Please adjust processing conditions if the vibration is generated.

(Note 2) If the cutting angle between the tool and workpiece exceeds 90º when machining corners ,Reduce the cutting speed and table feed by 10-20% and ae by 50%. Also if possible, set a radius cutting path for corners.

*1 Please note that machining performance varies depending to the conditions such as machine rigidity, work clamping rigidity, coolant supply system, pressure and flow volume etc.

*2 Internal coolant is recommended. Please use an FMH type arbor for through coolant. Using external coolant in combination with through coolant is even more effective.

*3 The tool life ratio shows the standard when ae = tool diameter × 20% is assumed to be 100 when shoulder cutting.

*4 The maximum depth of cut (apmax) varies according to the machine rigidity and power.

*1 Please note that machining performance varies depending to the conditions such as machine rigidity, work clamping rigidity, coolant supply system, pressure and flow volume etc.

*2 Internal coolant is recommended. Please use an FMH type arbor for through coolant. Using external coolant in combination with through coolant is even more effective.

*3 The tool life ratio shows the standard when ae = tool diameter × 20% is assumed to be 100 when shoulder cutting.

*4 The maximum depth of cut (apmax) varies according to the machine rigidity and power.

FITTING INSERTS ON HOLDERS

1. Clean the insert seat

Clean the insert seat in the holder body by blowing air or using a brush.

2. Fit the insert

Place the concave mark of the insert into the clamp-screw-fastening part of the holder(only SRF type inserts). Fasten the clamp screw while firmly pressing the insert against the insert seat wall. You are recommended to use the special lubricant for preventing screw seizing, MK1KS, and to fasten with recommended torque.

SRF/SRB

RECOMMENDED CUTTING CONDITIONS

	Work Material	Hardness	Grade	Cutting Speed **vc** (m/min)	Feed per Tooth **fz** (mm/t.)	Depth of Cut **ap** (mm)
P	Mild Steel (ASTM A36, AISI 1010)	≤180HB	**EP6120**	200 (80—300)	0.2 (0.1—0.3)	≤0.05DC
	Carbon Steel, Alloy Steel (AISI 1045, AISI 4140)	180—280HB	**EP6120**	200 (80—300)	0.2 (0.1—0.3)	≤0.05DC
			VP15TF	200 (80—300)	0.2 (0.1—0.3)	≤0.05DC

			VP15TF	150 (80—200)	0.2 (0.1—0.3)	≤0.05DC
K	Gray Cast Iron (FC300)	Tensile Strength ≤350MPa	**MP8010**	250 (80—450)	0.2 (0.1—0.3)	≤0.05DC
	Ductile Cast Iron (FCD450)	Tensile Strength ≤450MPa	**MP8010**	200 (80—300)	0.2 (0.1—0.3)	≤0.05DC
	Ductile Cast Iron	Tensile Strength ≤800MPa	**MP8010**	200 (80—300)	0.2 (0.1—0.3)	≤0.05DC
N	Copper, Copper alloys		**EP6120**	200 (80—300)	0.2 (0.1—0.3)	≤0.05DC
H	Hardened Steel	45—55HRC	**MP8010**	100 (60—120)	0.2 (0.1—0.3)	≤0.05DC
	Hardened Steel	55—65HRC	**MP8010**	80 (60—120)	0.2 (0.1—0.3)	≤0.01DC

(Note 1) The above values are average condition values at actual cutting speeds. The values change slightly according to the state of a machine to be used and method of workholding. Adjust the values depending on an actual machine condition, referring to the above values.
(Note 2) For end mills with a carbide shank, you will be able to set about 20 percent higher cutting conditions.
(Note 3) Please note the following when machining hardened steel with MP8010.
- Please shorten the overhang length as much as possible.
- Use with carbide shank recommended.
- Please note the setting of the depth of cut especially to prevent the fracture.

CUTTING SPEED FORMULAE

1. Employing $\theta°$ ➡ Calculate cutting speed at point P.
(Cutting speed at the cutting depth border for oblique machining)

Formula : Cutting Speed = $\dfrac{\pi \cdot DC \cdot \sin\theta \cdot n}{1000}$ (m/min)

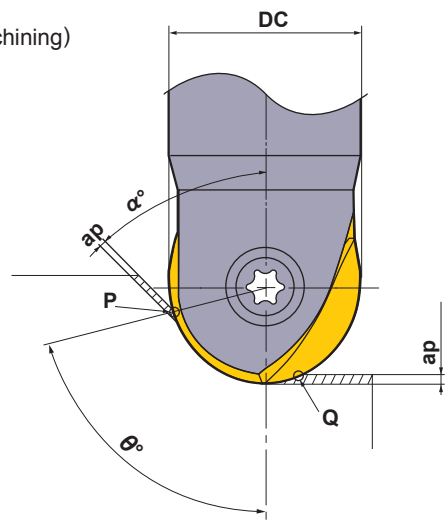
$$\theta° = \cos^{-1}\left(\frac{DC-2ap}{DC}\right)+90-\alpha$$

n : Spindle Speed (min^{-1})

2. Employing ap ➡ Calculate cutting speed at point Q.
(Cutting speed at the cutting depth border)

Formula : Cutting Speed = $\dfrac{2\pi n\sqrt{ap\,(DC-ap)}}{1000}$ (m/min)

n : Spindle Speed (min^{-1})
DC : Cutting Edge Diameter (mm)
ap : Depth of Cut (mm)



SUF

Corner radius end mill, short cut length, 4-6 flute

FITTING INSERTS ON HOLDERS

1. Clean the insert seat

Clean the insert seat in the holder body by blowing air or using a brush.

2. Fit the insert

Place the concave mark of the insert into the clamp-screw-fastening part of the holder(only SRF type inserts). Fasten the clamp screw while firmly pressing the insert against the insert seat wall. You are recommended to use the special lubricant for preventing screw seizing, MK1KS, and to fasten with recommended torque.

H	Hardened Steel	45—55HRC	**MP8010**	100 (80—120)	≤0.01DC	≤DC	0.1 (≤0.2)
H	Hardened Steel	55—65HRC	**MP8010**	70 (60—80)	≤0.01DC	≤DC	0.1 (≤0.2)

* When the pick feed direction is along the axis of the tool such as finish machining at the wall part.

(Note 1) This cutting condition is the standard condition when using the steel standard shank type. If it is occurred vibration or chipping on the cutting edge, please decrease the cutting condition as width of cut, depth of cut and feed per tooth depending on the situation.

(Note 2) The value of cutting speed is stood at the peripheral diameter of the tool. Please calculate the spindle speed of tool in the following expressions.

Spindle speed of cutting tool n(min^{-1})=1000×Cutting speed vc ÷Diameter of cutting tool DC÷3.14

(Note 3) Please note the following when machining hardened steel with MP8010.

- Please shorten the overhang length as much as possible.
- Use with carbide shank recommended.
- Please note the setting of the depth of cut especially to prevent the fracture.

(Low-resistance inner or outer inserts are precision M class type.)

*1 Selection guide for peripheral cutting edges : The first recommendation is the super sharp M breaker (APMT....PDER-M2).
When cutting edge strength is particularly important, use the H breaker (APMT....PDER-H2).

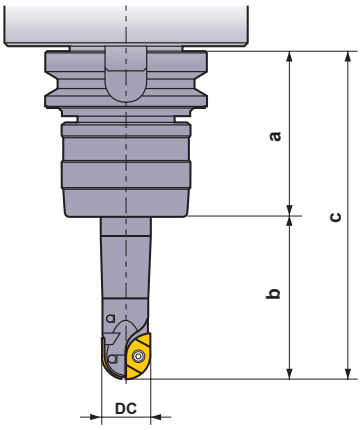
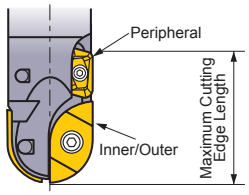
SRM2

RECOMMENDED CUTTING CONDITIONS

SRM2 Ø16—Ø32





(Long Cutting Edge)

Tool Overhang

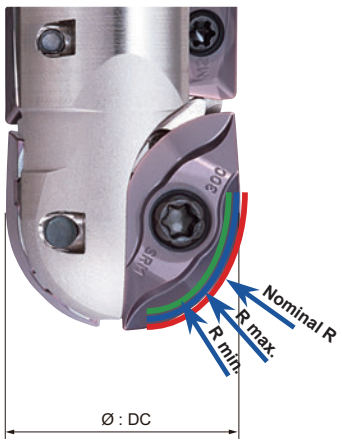
The recommended cutting conditions are chosen based on deflection, vibration and surface finish when using a BT50 arbor under the conditions below -**"a"**, a length from a gauge line to the arbor end face and **"b"**, neck length (tool overhang from the arbor).

Cutting Edge Diameter:DC	Type	a	b	c
16	Standard	105	50	155
	Long Neck		70	175
	Extra Long		—	—
20	Standard		70	175
	Long Neck		100	205
	Extra Long		150	255
25	Standard		80	185
	Long Neck		120	225
	Extra Long		200	305
30	Standard		100	205
	Long Neck		150	255
	Extra Long		250	355

Recommended Depth of Cut for Long Cutting Edge Type

The maximum cutting edge length of the long cutting edge type with a peripheral insert is 1.4-1.5DC. The peripheral insert's main purpose is to remove the small un-machined portions of the pre-machined surface above the main cutting edge. Recommended depth of cut: **Maximum ap** is 0.5DC or below.

Radius tolerance and other dimensions with an insert mounted in the body



Radial tolerance

	Nominal R	Tolerance	R min.	R max.
16	8	G	7.925	7.975
		M	7.910	7.970
20	10	G	9.925	9.975
		M	9.910	9.970
25	12.5	G	12.425	12.475
		M	12.410	12.470
30	15	G	14.925	14.975
		M	14.910	14.970

Dimensions with an insert mounted in the body

	Tolerance	DC min.	DC max.

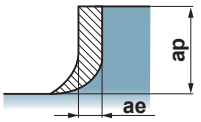
SHOULDER MILLING (Cutting Depth : Large)

Cutting Mode



N : Revolution (min^{-1})
F : Table Feed (mm/min)

(Note) Machining Stainless Steels

When up-cut milling stainless steels at large depths and widths of cut, the machined surface is liable to burrs and welding due to chip jamming. For stainless steels, down-cutting (climb milling) is recommended.

(Low-resistance inner or outer inserts are precision M class type.)
∗1 Selection guide for peripheral cutting edges : The first recommendation is the super sharp M breaker (APMT....PDER-M2).
When cutting edge strength is particularly important, use the H breaker (APMT....PDER-H2).

● : Inventory maintained in Japan. (10 inserts in one case)(Inserts with asterisk (∗2) are available in 2 piece in one case)

			MB710	1000 (800—1200)	

●Revolution (min^{-1})=(1000 x Cutting Speed)÷(3.14 x DC)
●Table Feed (mm/min)=Feed per Tooth x Number of Teeth x Cutter Revolution
(Note 1) Recommended radial depth of cut is 0.1mm.
(Note 2) 2 directional vertical cutting is recommended for efficiency.
(Note 3) For crossfeed cutting, the feed per tooth should be reduced to less than 0.05(mm/t.).

PMR

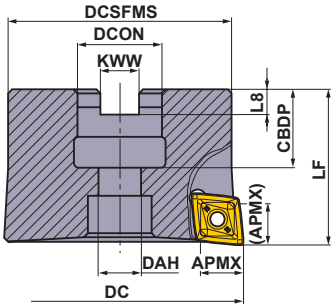
VERTICAL FEED MILLING

Product Information

Work Material

SYMBOL DESCRIPTIONS >> 1350
TECHNICAL DATA >> 1987
ISO13399 Property >> 1966

- 1 directional cutting with large overhang.
- Horizontal feed cutting and oblique cutting are also possible.
- Unique shape of curved edge gives high rigidity and low resistance.



Right hand tool holder only.

ISO13399 Property >> 1966

Body with Peripheral Cutting Edge Run-out Regulator

With peripheral cutting edge regulating function for possible use of economical M-class inserts.
* The bodies are only available by special order.

High Clamping Rigidity

High feed processing possible with improved fracture resistance.

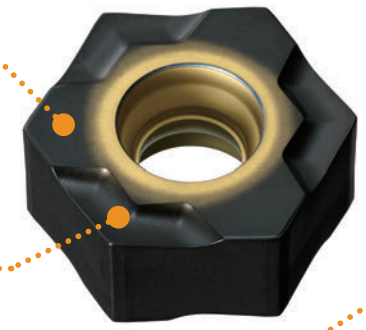
Double Positive Breaker

Reduced cutting resistance. Supports open deck work. Effective finished surface due to wiper edge.

12-Corner Type with Right Hand

Economical 12-corner type that preserves comparable insert rigidity of the 6-corner type by securing the seating surface directly below where the cutting force is absorbed.

Double-sided 6-corner type (No hand)



Double-sided 12-corner type (Right hand only)

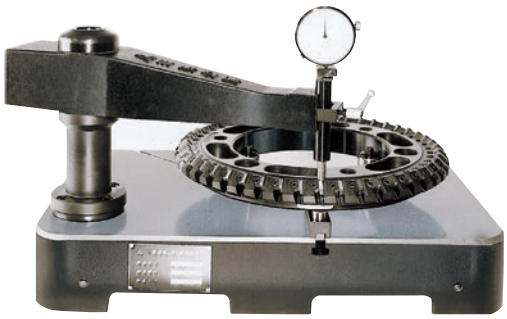
SEF SETTING FIXTURE

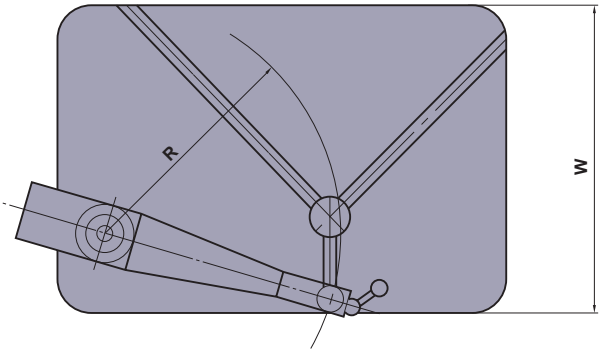
SYMBOL DESCRIPTIONS >> 1350
TECHNICAL DATA >> 1987
ISO13399 Property >> 1966

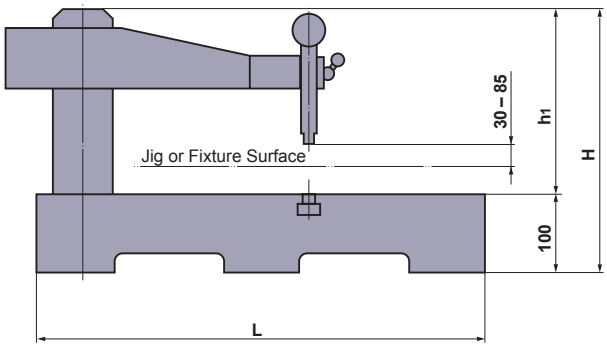
FEATURES OF SETTING FIXTURE

- **Compact design.**
- **Easy set up operation.**
- **Insert is adjusted from the cutting edge point therefore run-out accuracy is high.**



SETTING FIXTURE STANDARD

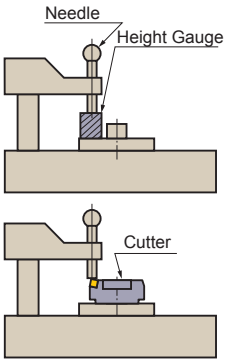




Order Number	R	L	W	H	h1	Cutter Diameter
SEF500	315	600	400	347	247	—ϕ500
SEF700	400	800	500	360	260	ϕ315—ϕ700

(Note 1) Please specify the order number when ordering.
(Note 2) Please contact us regarding special spare parts order.

Method of Insert Setting for One Piece Type.

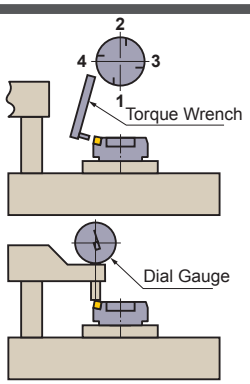


①Set the needle using a height gauge which is the same height as the cutter.

②Move the needle to an insert.

③Slide the insert to the point where it touches the needle Tighten all the inserts lightly. (Use torque wrench.) (1—2N • m)

*Screwing the inserts too tightly results in lower accuracy.



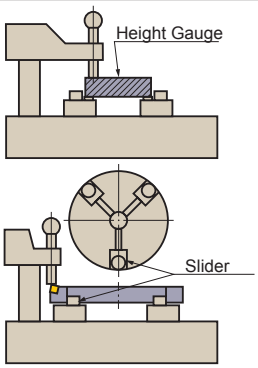
④After temporary tightening, use a torque wrench to tighten firmly. (Use torque wrench.) (8 N • m)

⑤Screw the inserts tightly according to the picture shown on the left.

⑥Check run-out of all the inserts with a dial gauge.

*For general milling, ≤10μm is the standard. For finishing,set the insert run out at≤5μm.

Method of Insert Setting for Two Piece Type.



①Set the height gauge at the same height as the cutter on the liners of slider, then set the needle.

②Put the cutter on the liners of the slider and move the rollers of the slider to the installation holes.

③Make sure that the three rollers are free, then fix the sliders.

*Process of tightening the inserts is the same as the one piece type.

●Note

1. After machining, dust off chips on the cutter with air before loosening the wedge.
2. When loosening clamp screws, avoid using a damaged wrench.
3. Alien substances attached to inserts lowers run-out accuracy and damages the cutter body. Therefore, they need to be cleaned throughly.
4. After all the inserts are taken out, clean the cutter body with oil or strong air blow.
5. Use a torque wrench or special wrench for tightening the clamp screws.

HOW TO INSTALL THE SCREW-IN HEAD

①Thoroughly clean the clamp section of the head and the arbor with an air blower or brush before installation.

②Tighten the head at the recommended torque and ensure that there is no gap between the head and arbor.

Screw Size	Recommended Torque (N • m)	Wrench Size (mm)
M8	23	10
M10	46	14
M12	80	19
M16	90	24

●Cutting tools become extremely hot during cutting. Never touch them with bare hands after operation as this mayproduce risk of injuries or burns.
●Do not handle the cutting tools with bare hands as this may cause injuries.

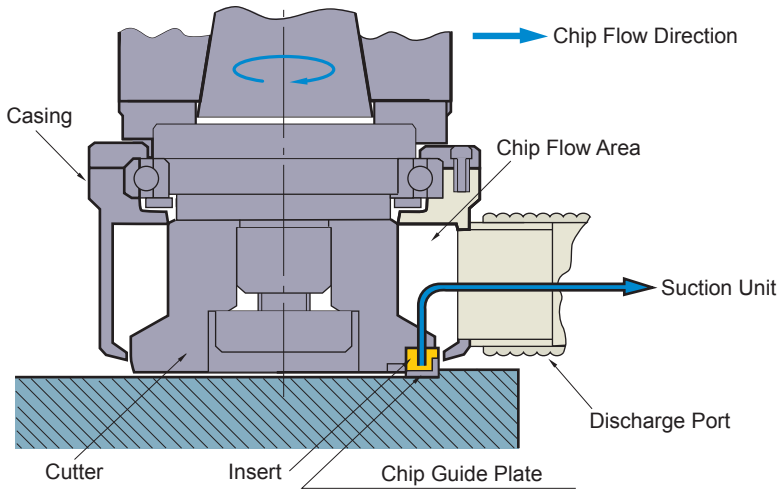
SYMBOL DESCRIPTIONS >> 1350
TECHNICAL DATA >> 1987
ISO13399 Property >> 1966

STRUCTURE

- **Automatic continuous intake of chips while machining.**
- **Eliminates chip handing problems.**



1 Cutting is performed by a face mill.

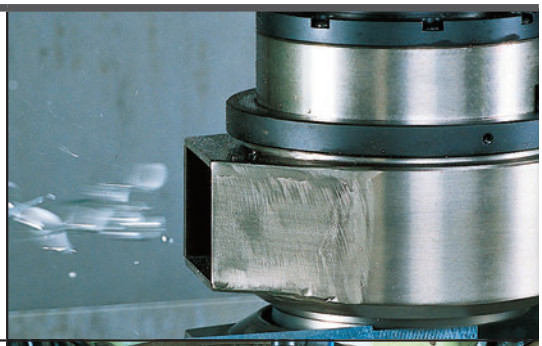
2 Chips are directed into the casing by way of the chip guide plate.

3 Chips are expelled via the discharge port.

CHIP COLLECTION METHOD

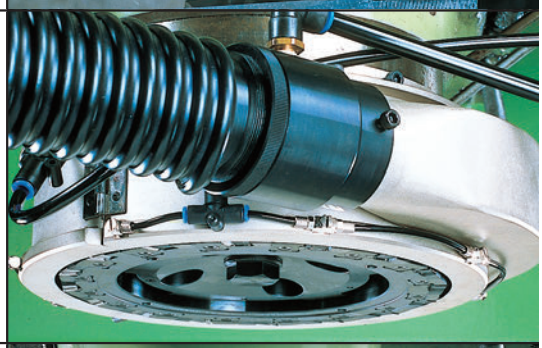
Self Expulsion Type QMC

①Chips are discharged towards the chip conveyor because of the centrifugal force created by the cutter.
②Installation with an ATC(auto tool changer) on machining centers is possible.
③Since there is no need for air or a dust collector, this method provides the lowest initial investment and running costs.
④Chips cannot be transported (carried) directly over long distances.
⑤High speed bearing required to suit high speed machining.



Double Air Type QWA

①Chip recovery using compressed air (factory air).
②Since air is also injected into the casing interior, wet cutting is also possible.
③Achieves the same suction capabilities as a dust collector, thereby enabling low equipment costs.
④Wet cutting is not recommended.



Vacuum Machine Type QSV

①Chip collection by use of a suction machine.
②Chip collection efficiency is high.
③Special equipment is required, such as a mist collector for wet cutting.

* A variety of other tool holders, such as BT shanks with their distinctive double face contact, can be mounted as well.

Spare Parts (Reamer Adjustment Screws)

(mm)

Geometry	Order Number	Stock	MPCA	MPCB	MPCC	MPCD	MPCE	MPCF
	**HSC05016HW**	●	5.8	M5×0.8	14	2	2	2.5

Reamer adjustment screws can be operated using a wrench from both the reamer insertion hole side and the mounting side.
The reamer adjustment screw is an accessory (1 piece), which can also be additionally purchased as a stand-alone item.
A hexagon socket set screw (M4) is included with the tool holder. It should be used as a stopper when discharging coolant with the use of an external oil supply.

● : **Inventory maintained in Japan.**

Valve Finisher

Produced-to-Order Products Please inquire with our Sales Department regarding production.

For Valve Guide Hole Reaming

Compatible Reamer Range : ≤ **ø6** (Guide Hole Diameter)

RT9005

Optimization and strengthening of the hard phase (WC) particle diameter and bonded phase (Co) have improved the wear resistance and fracture resistance, for the creation of a unique cemented carbide.

EF05

An ultra-high hardness, ultra micro-particle cemented carbide that contains specialized components. Just as with RT9005, its wear resistance and fracture resistance have been improved.

Coating (TiN)

The hard coating with smooth surface properties can maintain an excellent finished surface over extended periods of time.

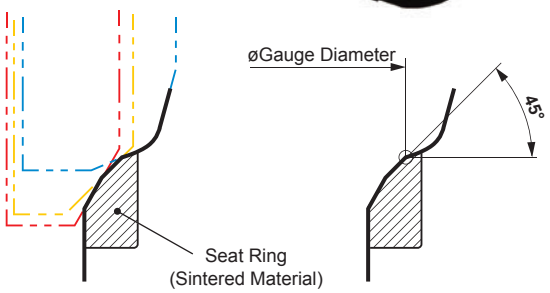
For Seat Surface Machining

Compatible Head Range : **ø20** ≤ Head Diameter < **ø35**
(Seat Hole : 45°-Surface Gauge Diameter)

Tool Bits : 3 types

MB4020

High edge toughness has been achieved with a newly-developed special binder. The even sharper cutting edge shape can suppress the creation of burrs and ensure high accuracy. CBN, which is included with a high chemical content, has outstanding welding resistance so that a constant dimensional accuracy can be maintained.



● The seat surface is composed of 3 faces at different angles (Cutting with 3 types of edges).

Relationship between number of head cutting edge grooves and tool holders

* HVF06-HSK63A110A◌ : Suitable for cases with no processing beyond the angle plate
* HVF06-HSK63A180A◌ : Suitable for cases with processing beyond the angle plate

Order Number	Coolant Hole (Hole)	Number of Cutting Edge Grooves on Head			
		1	2	3	4
HVF06-HSK63A110A3	**3**	○	×	○	×
HVF06-HSK63A180A3	**3**	○	×	○	×
HVF06-HSK63A110A4	**4**	○	○	×	○
HVF06-HSK63A180A4	**4**	○	○	×	○

○ = Suitable × = Unsuitable

* Hexagon socket set screws (M4) are included as separately-packaged accessories.

Important! Install screws in any unused coolant holes.

Valve Finisher

RECOMMENDED CUTTING CONDITIONS

Valve Guide Hole Reaming

Work Material	Reamer Material			Cutting Speed **vc** (m/min)	Feed per Tooth **fz** (mm/t.)
	Grade	Hardness (HRA)	Bending Strength (Gpa)		
Steel-based Sintered Alloy	**RT9005**	92.2	2.0	40 — 60	0.03 — 0.05
Cast Iron	**EF05**	94.0	2.5		

Seat Surface Machining

Work Material	Priority	CBN Material for Bits	Cutting Speed **vc** (m/min)	Feed per Tooth **fz** (mm/t.)
Sintered Alloy	1	**MB4020**	60 — 120	0.05 — 0.10
	2	**MB825**		
	2	**MB835**		

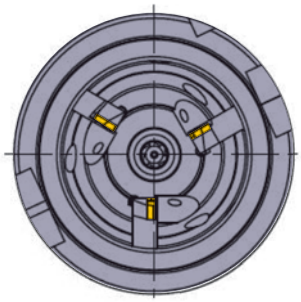
* Select materials in accordance with seat material characteristics.

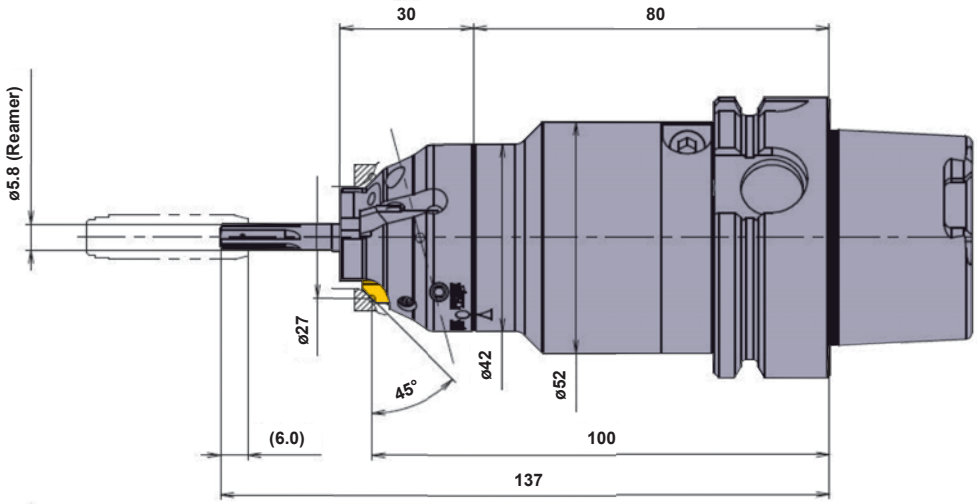
Setup Reference Diagram

(When Tool Holder : HVF06-HSK63A110A3 is suitable)

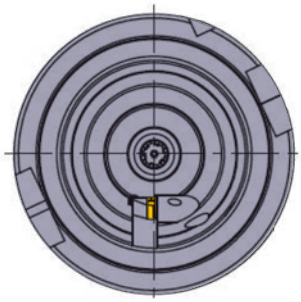
(mm)

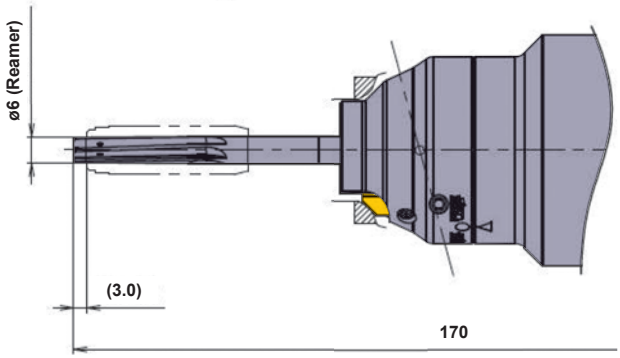
Rough Processing





Finish Processing





Valve Finisher

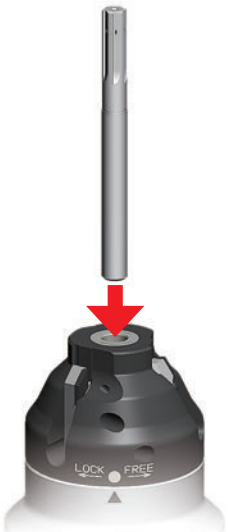
Procedure

STEP 1

Mount the head on the tool holder.

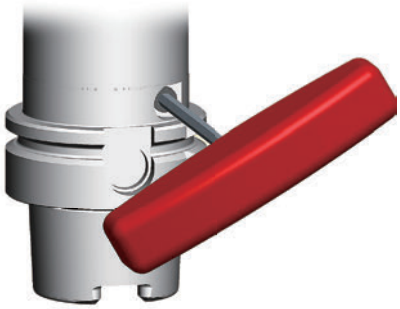
STEP 2

Attach the reamer.



STEP 3

Tightening and removing screws follow opposite procedures from the usual.



During use, line up the markings on the head and tool holder to secure them in place. When mounting and removing them, turn them to the side marked “FREE”.

Secured Position

MI TYPE BORING BARS

Memo

CLASSIFICATION OF QUICK CHANGE / MODULAR TOOLING SYSTEM

Mitsubishi's quick change system is a must for improving efficiency in mass production lines.

- Shorten tool change times and increase machine efficiency.
- Reduce tool weight. Thus, tool change is safer and easier.
- Improve cutting edge accuracy.

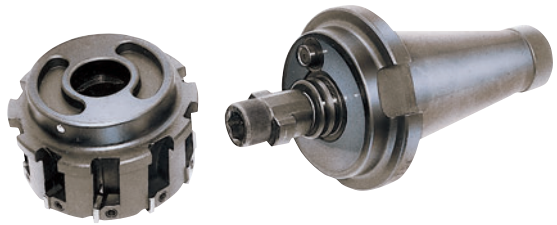
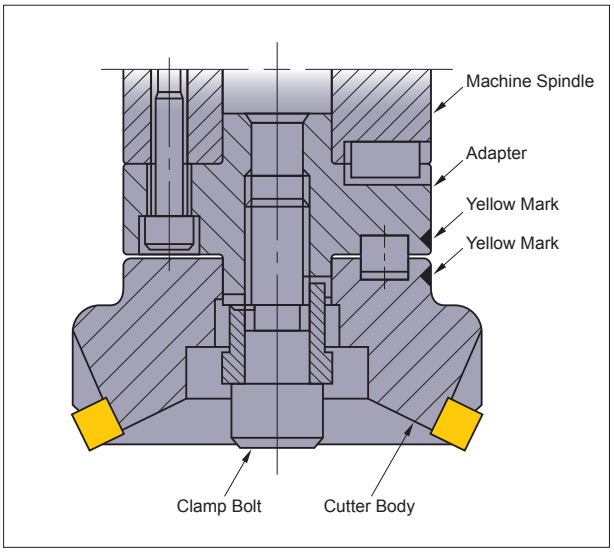
FACE MILL

QF2000 (SINGLE BOLT MOUNTING TYPE)

●One Piece Type (≤ϕ160)

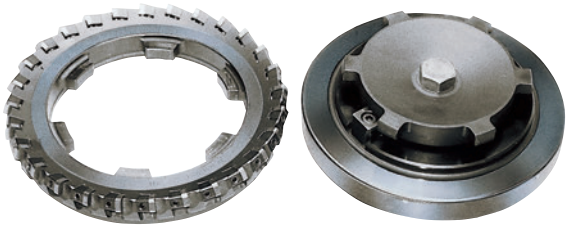


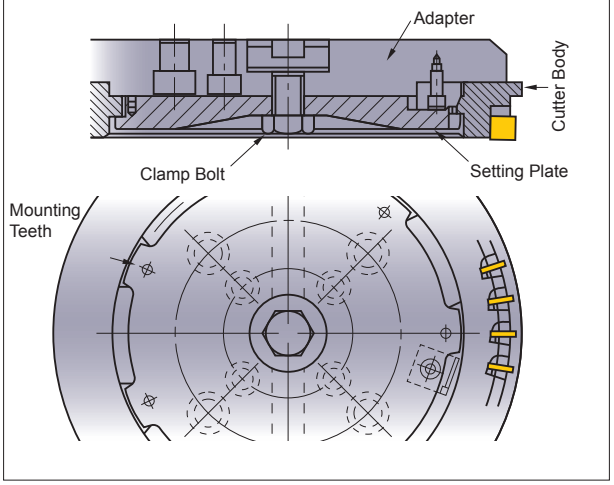


FEATURES

1. Simply turning a clamp bolt fixed to the adapter a few times enables cutter exchange.
2. The cutter needs to be turned 90° before removal. This prevents the cutter from falling free.
3. Applicable to both face milling and boring tools.
4. Cutter exchange time is less than 1 min.

●Two Piece Type (≥ϕ200)





FEATURES

1. Internal diameter of the cutter body has 4—6 mounting teeth. The adapter has the same mounting teeth and a single clamp bolt for installation.
2. The cutter needs to be turned 15° before removal. This prevents the cutter from falling free.
3. Cutter exchange time is less than 1 min.

QF1000 (GOURD SHAPED HOLE TYPE)

●One Piece Type (O Type ϕ200)

●Two Piece Type (T Type ≥ϕ250)

FEATURES

1. Gourd shaped hole type is employed. Turning 4—6 bolts enables cutter exchange.
2. The cutter needs to be turned 15° before removal. This prevents the cutter from falling free.
3. Cutters with ≥Ø250 are made up of 2 parts. Thus, weight at the time of installation is reduced and safety is improved.
4. Standard adapters facilitate installation of cutters with the same diameter and different insert shapes.
5. Cutter exchange time is less than 3—5 min.

SIDE CUTTER

QC TYPE ADAPTER FOR PIN MILLING CUTTER

Cutter Body

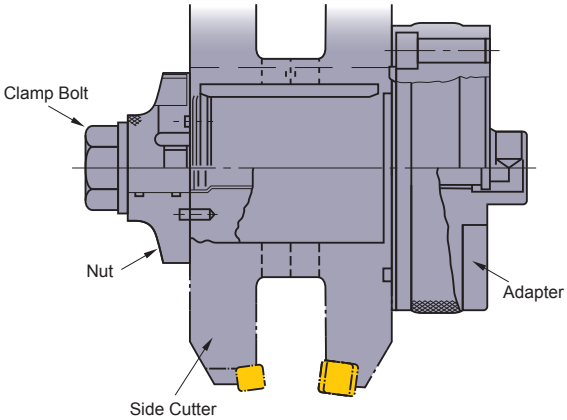
Adapter Body

FEATURES

1. Makes installation of Pin millng cutter easy, quick, and accurate.
2. Clamping the entire periphery of the cutter body improves rigidity and lateral run-out of the cutting edges.
3. Facilitates stable heavy cutting such as counter weight cutting and prevents sudden insert fracture.

QS2000 (INSTALLATION METHOD FOR SIDE CUTTER)

Appearance

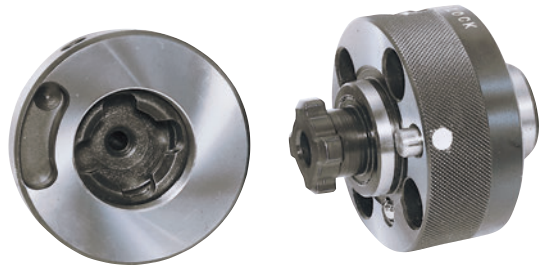


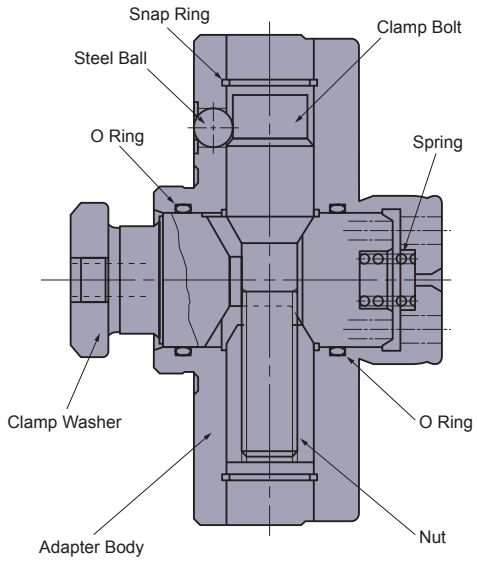
FEATURES

1. Turning the bolt a few times turns nut 45° and enables installation and detachment of the cutter.
2. Installation and detachment of the cutter is possible without taking the bolt and nut off the adapter.
3. The cutter is a solid type. Thus, the rigidity is high.
4. Cutter exchange time is less than 1 min.

BORING TOOL

QB4000 TYPE (SIDE CLAMP TYPE)





FEATURES

1. Tightening the clamp bolt (or clamp nut) draws the clamp washer in and securely holds the boring head.
2. The clamp washer has mounting teeth at the end. Turning the clamp washer 45° enables installation and detachment of the boring head.
3. Both 1/5 taper and cutter locating faces support the boring head. Thus, clamp rigidity and installation repeatability accuracy are high (2–3μm).
4. A side clamp structure is employed. Thus, a spindle turning stopper is unnecessary. This structure prevents the boring head from falling free.
5. Insert location close to the adapter body allows for convenient head exchange.
6. Suitable for a wide range of boring, from small to large diameters.
7. Head exchange time is less than 1 min.

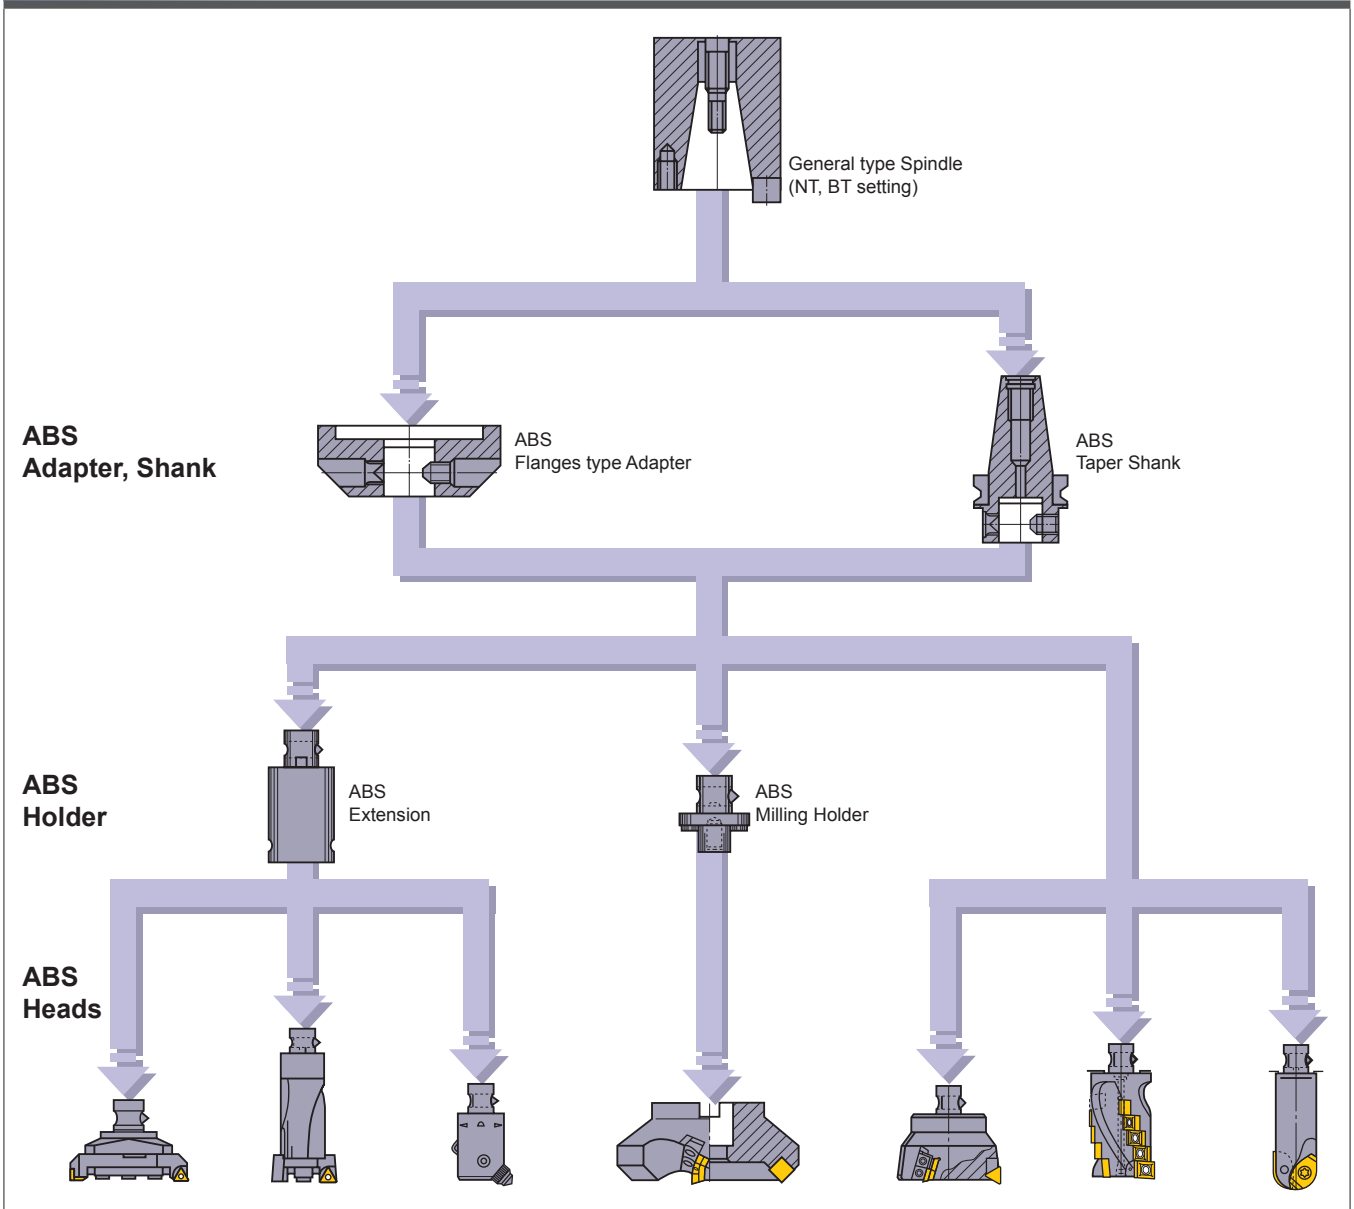
ABS License KOMET

ABS SYSTEM CHARACTERISTIC

- High rigidity and high coupling strength.
  The taper wedge effects produced by the clamping screw, the taper screw, and the slide pin enable strong and firm coupling between the head and the adapter.
- As the cutting torque acts as torsion force on the axis, 50%—80% improvement is achieved for the clamping strength in the coupled portion axis direction.
- High accuracy is guaranteed.
  An attachment repeat accuracy of 2—3μm is constantly maintained in the coupled portion.
- From small (ϕ20) diameter to large diameter (ϕ200), a wide range of tooling is possible.
- Internal passage of the coolant (air) is possible without modifications to standard machinary.
- Tool head extensions are easy through the use of extension pieces.
- Through the use of reducers, tool head diameters are easily set.

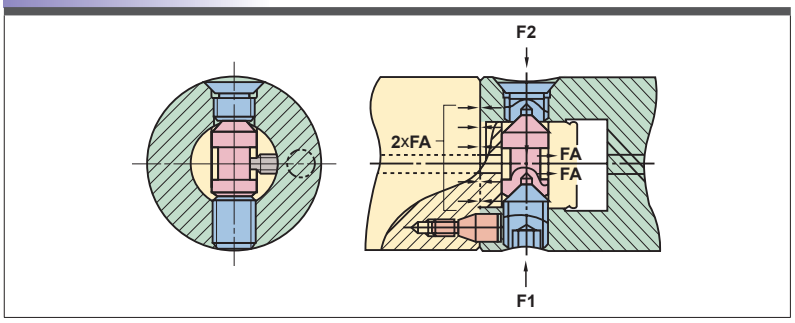
ABS SYSTEM MECHANISM

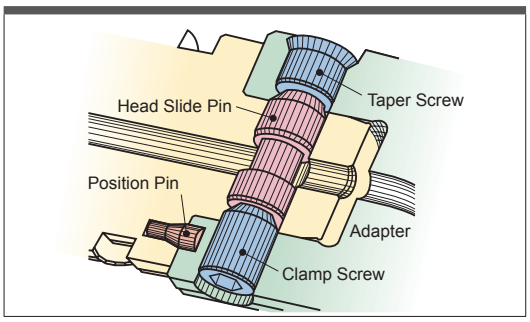


(Note) The above chart also indicates the KOMET® standard.

ABS License KOMET

ABS SYSTEM COMPONENT

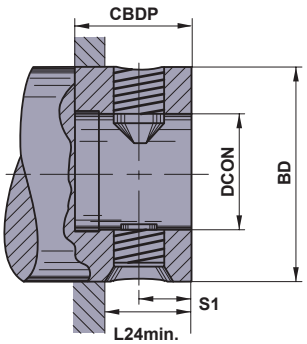




When the force F1 presses on the clamping screw, the slide pin moves in the radial direction and impinges on the taper screw, generation the reaction force F2. Since the centers of the clamping screw, the taper screw, and the slide pin are eccentric, a taper connection is made at sites separated by a 180° phase, with the clamping screw and the slide pin on the taper right impingement portion, and the slide pin and taper pin on the taper left impingement portion. The result is that, a vector analysis of those forces shows, as depicted in the diagram above, that the slides move in an identical direction, and the coupling force FA is doubled and transmitted accordingly. Further, cutting resistance generated during cutting becomes torsion stress and is transmitted accordingly. The forces F1 and F2 generated with the clamping screw and taper screw are expanded, and the coupling (jointing) force FA becomes as even greater force, and is generated accordingly.

* This system is licensed from KOMET© of Germany. (JP Patent NO.1328669)

ABS SYSTEM SETTING STANDARDS Adapter Dimensions



Order Number	Dimensions(mm)

HSK SYSTEM

FEATURES OF THE HSK SYSTEM

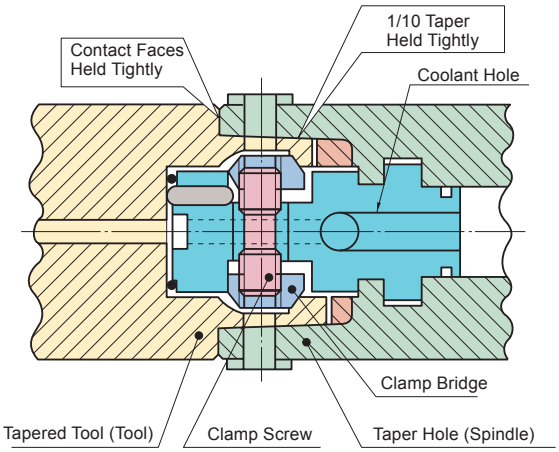
●**Suitable for high speed machining.**
When the taper hole is slightly seperated during high speed machining due to centrifugal force, the taper axis is continuously in contact with the taper hole because of elastic deformation. Thus, 2 face holding is maintained.

●**Guaranteed high accuracy.**
Installation repeatability of 2μm is guaranteed.

●**High rigidity.**
High rigidity in the radial and thrust direction due to the 2 face holding system.

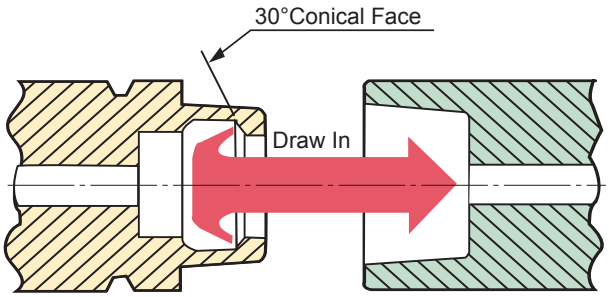
●**Easy installation.**
Detachable support structure ensures separation of the tool even when the tool has undergone thermal expansion.

●**Coolant system selection.**
Center coolant and anglar flow coolant type.



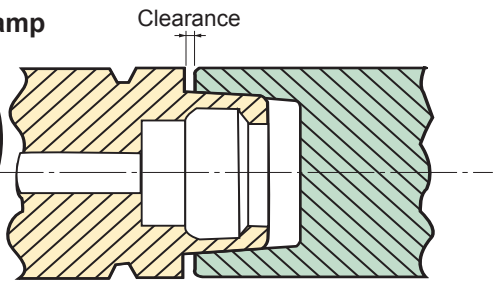
* HSK stands for **Hole** (Hollow) **Schaft** (axis) **Kegel** (taper) in German.

HSK CLAMPING METHOD



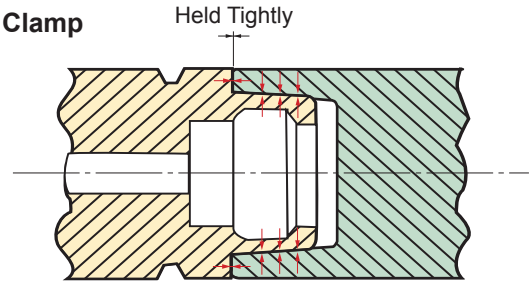
●The 30°conical face of the taper axis is pulled in the direction of the tapered hole to clamp.

●**Temporary Clamp Position**
(**The spindle taper face and the tool taper face contact.**)



●Temporary clamp position has a clearance between the spindle and the tool contact faces.
●Taper clamping force increases as the diameter increases.

●**Permanent Clamp Position**



●Hollow thin taper axis holds the taper faces and the contact faces tightly due to pressurized elastic deformation.

HSK SYSTEM

HSK SYSTEM FORM

There are various HSK types.
Mitsubishi Materials produces A, B, C, and D types of taper axis (tool size) and C and D types (manual operation) of taper hole (spindle side).

Type	Application	Tapered Tool (Tool)	Tapered Hole (Spindle)
A Type	Automatic tool change (ATC), center coolant (mainly milling tools)	□	
B Type	Automatic tool change (ATC), angular flow coolant (mainly turning tools)	□	
C Type	Manual tool change, center coolant (mainly milling tools)	□	□
D Type	Manual tool change, angular flow coolant (mainly turing tools)	□	□

□ : Non stock, produced to order only.

IDENTIFICATION

PRODUCT CODE OF DRILLS

MV S 0300 X S

Product name

- **MV** : New generation for general-purpose
- **MW** : General-purpose
- **MF** : Solid Carbide Flat Bottom Drills
- **MG** : Micro Solid Carbide Gun Drill
- **MS** : MSE Drills
- **MN** : For Machining of Aluminium Alloys
- **MH** : For die & mould machining
- **MM** : For Machining of Stainless Steel
- **MQ** : Steel • For high feed cast iron machining
- **MC** : Drill for CFRP machining
- **MZ** : MZE/MZS Drills
- **MA** : MAE/MAS Drills

Coolant

- **E** : External Coolant
- **S** : Internal Coolant

Diameter

ex.
0050 → ϕ0.5
0300 → ϕ3.0

l/d

- **S** : 2D
- **M** : 3D
- **L** : 5D (MAE, MAS : 6D)
- **X** : 12D
- **X∗∗D** : ∗∗D

Type of shank

- **A** : Straight shank
- **B** : Integral shank
- **S∗∗∗** : Shank Diameter (MV Series)

∗Other special types can be ordered.

VC S S S D0300 ∗∗∗

Product name

- **VC** : Miracle drills
- **DC** : Diamond coated drills
- **VA** : Violet coated precision drills (High Grade, High Speed Steel)
- **SE** : SE High Precision Drill (High-Speed Steel)
- **V** : Violet drills
- **G** : TiN coated drills (High-Speed Steel)
- **E** : Co-HSS drills
- **B** : Blister packed drills
- **None**: High-Speed Steel

Applications

- **SD** : General-purpose straight drill
- **TD** : General-purpose taper drill
- **S** : For steel
- **H** : For high hardness
- **N** : For CN
- **PD** : For high-precision machining
- **U** : For stainless
- **T** : For steel frame
- **W** : For deep hole

Type of shank

- **S** : Straight
- **T** : Taper
- **3K** : Triangular
- **6K** : Hexagonal

Flute length

- **S** : Short
- **M** : Medium
- **L** : Long

Diameter

ex.
D0050 → ϕ0.5
D0300 → ϕ3.0

Others

- **A∗∗∗** : Overall Length
- **S∗∗** : Shank Diameter
- **M∗** : Taper size

∗Other special types can be ordered.

SYMBOL DESCRIPTIONS

Tool material

Ultra micro grain carbide
Ultra micro grain carbide is used as the substrate material.

High grade high alloy HSS
High grade high alloy HSS is used as the substrate material.

Cobalt high speed steel
Cobalt high speed steel is used as the substrate material.

D-STH cobalt high-speed steel
Cobalt high-speed steel is used as the substrate material with D-STH.

High speed steel
High speed steel is used as the substrate material.

Web thinning

X web thinning
X web thinning is used at the drill point.

Z web thinning
Z web thinning is used at the drill point.

XR web thinning
XR web thinning is used at the drill point.

C web thinning
C web thinning is used at the drill point.

S web thinning
S web thinning is used at the drill point.

N web thinning
N web thinning is used at the drill point.

● : Inventory maintained.

Application Range of Target Work Material

1st Recommenedation

P M S H N K

2nd Recommenedation

P M S H N K

Coating

Diamond Coating
Pure Diamond high performance coating excelling in film adhesion to the substrate.

Violet Coating
Increased tool life of 2–3 times that of TiN coated products.

TiN Coating
Increased tool life of 2–3 times that of non coated products.

Laminated PVD Coating
Exhibits outstanding wear resistance with a wide range of work materials including mild steel, carbon steel, alloy steel, stainless steel, cast iron-based materials, and aluminum alloys.

Super Multi-layer PVD Coating
Super multi-layer PVD coating material provides a life over 2 times longer than conventional materials.

PVD Coating
An ultra micro-grain cemented carbide optimal for stainless steel, and a PVD coating with outstanding heat resistance and lubricity.

MIRACLE Coating
The original Miracle (Al,Ti)N coating.
Also suitable for dry cutting.

CVD diamond coated end mills
Unique multi-layer micro-grain diamond crystal control technology drastically improves wear resistance and smoothness.

Angle and sharp corner edge

Point angle
Indicates drill point angle the tip.

WSTAR DRILLS SERIES

Product name, Shape	Features	Coating	Size range(mm)	Hole Depth (l/d)	Work material	Page
New Generation Pilot Drills						
PILOT-MVS	WSTAR DRILLS ● Pilot Drill	DP1	φ1.0-φ14.0	2	P M K S	1644
New Generation for Small Diameter						
MICRO-MVS	WSTAR DRILLS ● Linear tooth profile improves both chip discharge and cutting edge strength. ● Double margin specifications offer optimum balance and high precision with small drills.	DP1	φ1.0-φ2.9	7-30	P M K S	1647
New Generation for General purpose						
MVS	WSTAR DRILLS ● New grade DP1020 offers long tool life for a wide range of work materials. ● Unique coolant supply technology, TRI-cooling offers high machining efficiency.(on drills over ø6)	DP1	φ3.0-φ20.0	3-40	P M K S	1649
MVE	WSTAR DRILLS ● New grade DP1020 offers long tool life for a wide range of work materials. ● The unique wavy cutting edge provides excellent sharpness and rigidity and helps to control wear at the periphery.	DP1	φ3.0-φ20.0	2,3	P M K S H	1667

Product name, Shape	Features	Coating	Size range(mm)	Hole Depth (l/d)	Work material	Page
For Small Diameter・General Drilling・For Deep Hole						
MWS	WSTAR DRILLS ● For high accuracy and efficient drilling of carbon steels through to difficult-to-cut materials.	VP	φ0.5-φ25.0	1-30	P M K S	1674
MWE	WSTAR DRILLS ● For high accuracy and efficient drilling of carbon steels through to difficult-to-cut materials. ● Also suitable for lower speed applications.	VP	φ3.0-φ20.0	2,3	P M K S H	1694
For Machining of Steel and Cast Iron						
MQS	WSTAR DRILLS ● New grade DP3020, unique coolant system, triple margin. ● High efficiency and high accuracy machining of steel and cast iron is possible.	DP3	φ3.0-φ20.0	3-8	P K	1702
For Machining of Stainless Steel						
MMS	WSTAR DRILLS ● New grade DP7020, unique coolant system, special fine margin. ● Long tool life and high efficiency drilling for stainless steel.	DP7	φ3.0-φ20.0	3,5	M	1708
For Machining of Aluminium Alloys						
MNS	WSTAR DRILLS ● 4 holes special coolant system, good for resistance to adhesion. ● High efficiency drilling for aluminium alloy.	—	φ3.0-φ20.0	5-30	N	1714

Product name, Shape	Features	Coating	Size range(mm)	Hole Depth (l/d)	Work material	Page
For Die & Mould Machining						
MHS	WSTAR DRILLS ● High backling strength and unique double margin. ● Non-step drilling with long tool life for high hardness steel,35HRC-55HRC.	VP	φ0.95-φ12.0	1-30	P M S H	1722

MIRACLE MINI STAR DRILLS SERIES

Product name, Shape	Features	Coating	Size range(mm)	Hole Depth (l/d)	Work material	Page
For Small Diameter						
MSE 	MIRACLE MINI STAR DRILLS ● Wide flute for preventing chip jamming. ● Stable, small diameter machining.	VP	φ0.1-φ0.99	5-12	P M K S H	1732
MSP	● SPOT DRILLS	VP	φ3.0	–	P M K S H	1736

MIRACLE DRILLS SERIES

Product name, Shape	Features	Coating	Size range(mm)	Hole Depth (l/d)	Work material	Page
For Hardened steel						
VCSSS 3mm shank series	MIRACLE DRILLS ● First recommendation for pilot hole drilling of hardened material.	VC	φ0.3-φ2.4	5	P M K S H	1738
VCHSM	MIRACLE DRILLS ● A suitable geometry for high hardness(60 HRC) material drilling.	VC	φ2.5-φ16.0	3	S H	1740

ZET1 DRILLS SERIES

Product name, Shape	Features	Coating	Size range(mm)	Hole Depth (l/d)	Work material	Page
General Drilling						
MZE/MZS	ZET1 DRILLS ● Helical coolant hole enables high speed machining(MZS type).	VP	φ1.0-φ20.0	2-12	P M K S	1742
With Chamfered Cutting Edges						
MZE/MZS_STEP 	ZET1 DRILLS ● Pre-hole drilling for metric screw thread. ● Helical coolant hole enables high speed machining(MZS type).	VP	φ3.4-φ10.3	2,3	P M K S	1753

MGS GUN DRILLS SERIES

Product name, Shape	Features	Coating	Size range(mm)	Hole Depth (l/d)	Work material	Page
For Deep Hole						
MGS	SOLID GUN DRILL ● Micro deep hole drilling is possible. ● Excellent run-out accuracy ensures high precision drilling.	—	φ0.7-φ3.0	20-100	P M K S H	1758

MAE/MAS DRILLS SERIES

Product name, Shape	Features	Coating	Size range(mm)	Hole Depth (l/d)	Work material	Page
For Aluminium Alloy, Cast Iron						
MAE/MAS	● Specially for aluminium and cast iron drilling. ● High hole accuracy. ● Pre-hole drilling for roll taps. ● Helical through coolant hole enables high speed machining(MAS type).	—	φ3.0-φ16.0	3,6	K N	1762

SOLID CARBIDE FLAT BOTTOM DRILLS

Product name, Shape	Features	Coating	Size range(mm)	Hole Depth (l/d)	Work material	Page
Flat Bottom Solid Carbide Drills						
MFE	● High efficiency drilling in various types of machining.	DP1	φ3.0-φ20.0	2	P M K N	1768

DRILL FOR COMPOSITES

Product name, Shape	Features	Coating	Size range(mm)	Hole Depth (l/d)	Work material	Page
FOR COMPOSITE MATERIALS						
MCC	DRILLS FOR COMPOSITES ● The acute cutting angle thoroughly reduces thrust and minimizes delamination. ● The cutting edge rake angle has been strengthened in the vertical direction on the axis of rotation. As a result, it is possible to minimize un-cutting and delamination on sharp cutting edges.	DD	φ4.76-φ11.14	3	N	1774
MCA	DRILLS FOR COMPOSITES ● The groove design that covers up chips also minimizes back counter in addition to minimizing contact between the chips and the CFRP hole wall surface. ● Controlling the cutting heat reduces deterioration of the CFRP hole precision caused by heat (improves the internal air effectiveness).	DD	φ6.38, φ9.55	5	N	1775
MCT	DRILLS FOR COMPOSITES ● The sharp cutting edge in titanium machining which requires good CFRP hole quality and machining that minimizes the generation of cutting heat with low thermal conductivity achieves high-quality CFRP and titanium stack material hole machining.	—	φ6.38, φ9.55	5	N	1776

Product name, Shape	Features	Coating	Size range(mm)	Hole Depth (l/d)	Work material	Page
MCW	DRILLS FOR COMPOSITES ● The unique cutting edge with V-shaped grooves on the cutting edge controls the flow of chips generated at the outer circumference. Furthermore, this minimizes the hole diameter gaps in stack materials. Burr on the hole exit side is controlled by shifting the cutting load to the rotating shaft.	DD	φ6.38, φ9.55	5	N	1777
MCCH	DRILLS FOR COMPOSITES ● The hand tool ultra-hard substrate with enhanced strength prevents sudden breakages and maintains high quality holes. The double angle design controls the thrust and enables a stable cutting speed even in hand tool machining.	—	φ2.5-φ9.55	2-15	N	1778
MCAH	DRILLS FOR COMPOSITES ● The hand tool ultra-hard substrate with enhanced strength prevents sudden breakages and produces highly reliable hole machining. The combination of the groove shape and optimal twisting ensures compatibility of the aluminum chip dividing and discharging. This leads to stable hole machining even in CFRP and Aluminum stack material machining.	—	φ2.5-φ9.55	3-15	N	1779
MCS	DRILLS FOR COMPOSITES ● For high accuracy and efficient drilling of CFRP. ● Unique diamond coating produces excellent wear resistance and smooth hole surface.	DD	φ4.366-φ12.725	3	N	1780

Product name, Shape	Features	Coating	Size range(mm)	Hole Depth (l/d)	Work material	Page
For Non-ferrous Material						
DCSSS	CVD DIAMOND COATED DRILLS ● The original CVD diamond coating technology provides excellent adhesion for coating layer and enables stable drilling without peeling or chipping.	DC	φ0.2-φ2.0	-	N	1782
DCSSM	CVD DIAMOND COATED DRILLS ● The original CVD diamond coating technology provides excellent adhesion for coating layer and enables stable drilling without peeling or chipping.	DC	φ2.1-φ3.0	-	N	1784
For Hard Brittle Materials						
DCBSS	CVD DIAMOND COATED DRILLS ● For machining materials such as sintered ceramics and quartz glass that cannot be machined with conventional drills.	DC	φ0.05-φ3.0	-	N	1786

WSTAR INSERT TYPE DRILLS

Product name, Shape	Features	Coating	Size range(mm)	Hole Depth (l/d)	Work material	Page
General Drilling・For Bridge Construction						
STAW	SMALL DIAMETER INDEXABLE DRILLS ● Wavy cutting edge design for good chip control. ● Highly rigid clamping system offers stability and reliability for small hole drilling.	VP	φ10.0-φ18.4	1.5-8	P M K N	1880
TAW	WSTAR INSERT TYPE DRILLS ● Wavy cutting edge design for good chip control. ● Serration geometry for accurate insert location.	VP	φ18.5-φ30.4	3-8	P M K	1890

·BRAZED Drills

KEY POINT DRILLS

Product name, Shape	Features	Coating	Size range(mm)	Hole Depth (l/d)	Work material	Page
General Drilling						
BRS	● Excellent cutting sharpness and chip discharge due to high rake type insert. ● High efficiency, high accuracy machining.	UP	φ14.0-φ30.0	3	P M K	1867
BRM	● Excellent cutting sharpness and chip discharge due to high rake type insert. ● High efficiency, high accuracy machining.	UP	φ14.0-φ30.0	5	P M K	1869
For Bridge Construction						
BRSB/BRMB	KEY POINT DRILLS FOR BRIDGE CONSTRUCTION ● Excellent cutting sharpness and chip discharge due to high rake type insert. ● Unique flute shape is used. (l/d= 3,5)	UP	φ24.5-φ26.7	3,5	P	1871

NEW POINT DRILLS

Product name, Shape	Features	Coating	Size range(mm)	Hole Depth (l/d)	Work material	Page
General Drilling						
BRA	● Low thrust due to the absence of a chisel edge. ● Easy regrinding.	UP	φ8.0-φ40.0	3	P M K	1873
General Drilling (For turning)						
BRL	● Low thrust due to the absence of a chisel edge. ● Easy regrinding. ● Unique flute shape for lathes.	—	φ8.0-φ40.0	3	P M K	1876
For Bridge Construction						
BRB	NEW POINT DRILLS FOR BRIDGE CONSTRUCTION PARTS ● Low thrust due to the absence of a chisel edge. ● Easy regrinding.	—	φ24.5-φ26.7	3	P	1872

GUN DRILLS

Product name, Shape	Features	Coating	Size range(mm)	Hole Depth (l/d)	Work material	Page
Deep Hole Drills						
GUN DRILLS	● Gun drill for machining center. ● Easy regrinding. ● Unique flute shape for lathes.	—	φ2.0-φ30.3	–	–	1922

GUN REAMERS

Product name, Shape	Features	Coating	Size range(mm)	Hole Depth (l/d)	Work material	Page
Deep Hole Reaming						
GUN REAMERS	● Lead-angle is available to choose Straight or Spiral.	—	φ6.0-φ30.0	–	–	1923
Diamond Coated Deep Hole Reaming						
GUN REAMERS	● Suitable for Aluminum and Copper Alloys machining	—	φ6.0-φ30.3	–	–	1924

·Indexable Drill

MVX DRILLS SERIES

Product name, Shape	Features	Coating	Size range(mm)	Hole Depth（l/d）	Work material	Page
New Generation for General purpose						
MVX	MVX DRILLS SERIES ● Ideal combination of outer CVD insert and inner PVD insert. ● High rigidity body that enabled L/D=6 deep hole machining.	Additional Item	φ17.0-φ63.0	2-6	P M K	1902

TAF DRILLS SERIES

Product name, Shape	Features	Coating	Size range(mm)	Hole Depth（l/d）	Work material	Page
General Drilling						
TAF	TAF DRILLS SERIES ● High rigidity holder. ● 4 corner use insert. ● Various grades and chip breakers.	Additional Item	φ12.0-φ56.0	2-4	P M K	1912

DRILLS SELECTION CHART HSS

·Solid Drills

SE HIGH PRECISION DRILLS

Product name, Shape	Features	Coating	Size range(mm)	Hole Depth (l/d)	Work material	Page
General Drilling						
SEPDS	HSS MILLING SHANK DRILLS ● Unique D-STH process dramatically improves sharpness and welding resistance and smooth chip discharge.	—	φ0.5-φ4.0	-	P M K N	1789
SEPDM	HSS MILLING SHANK DRILLS ● Unique D-STH process dramatically improves sharpness and welding resistance and smooth chip discharge.	—	φ0.5-φ4.0	-	P M K N	1791

VIOLET COATED DRILLS

Product name, Shape	Features	Coating	Size range(mm)	Hole Depth (l/d)	Work material	Page
General, High Precision						
VAPDS	VIOLET DRILLS ● Highly efficient drilling and long tool life have been achieved with the newly developed Violet coating. (Standard drilling depth : 3 times or below the drill diameter)	V	φ0.5-φ13.0	–	P M K S	1793
VAPDM	VIOLET DRILLS ● Highly efficient drilling and long tool life have been achieved with the newly developed Violet coating. (Standard drilling depth : 5 times or below the drill diameter)	V	φ0.5-φ32.0	–	P M K S	1798
General, High Precision Steel						
VAPDSSUS	VIOLET DRILLS ● New design and the Violet coating combination enable high efficiency drilling and long tool life for drilling of stainless steels.	V	φ0.5-φ20.0	–	P M K N	1802

Product name, Shape	Features	Coating	Size range(mm)	Hole Depth (l/d)	Work material	Page
VAPDMSUS	VIOLET DRILLS ● New design and the Violet coating combination enable high efficiency drilling and long tool life for drilling of stainless steels.	V	φ0.5-φ13.0	–	P M K N	1809
Spot Milling						
VAPDSCB	VIOLET DRILLS ● Unique geometry offers high efficiency counter boring. Excellent chip breaking and flat counterbored surface.	V	φ2.0-φ32.0	–	P M K N	1815
General Drilling						
VSD	VIOLET DRILLS	V	φ0.5-φ13.0	–	P M K	1818
General Shot Taper						
VTDS	VIOLET DRILLS	V	φ6.0-φ32.0	–	P M K	1821

STRAIGHT SHANK DRILLS

Product name, Shape	Features	Coating	Size range(mm)	Hole Depth (l/d)	Work material	Page
General Drilling						
GSD	TiN, STRAIGHT SHANK	G	φ0.5-φ13.0	–	P M K N	1823
SD	● For general drilling.	—	φ0.2-φ17.5	–	P M K N	1826
SD	STRAIGHT SHANK, 1/100mm ● The diameter tolerance is 0~ -0.007 mm.	—	φ0.25-φ5.95	-	P M K N	1829
For Stainless Steel						
KSD	COBALT HSS, STRAIGHT SHANK DRILLS ● Sharp edge geometry for stainless steels up to 200HB.	—	φ1.0-φ13.0	–	P M N	1834

Product name, Shape	Features	Coating	Size range(mm)	Hole Depth (l/d)	Work material	Page
For Deep Hole						
SDLS	STRAIGHT SHANK DRILLS ● It is recommended to use when long overall length is demanded for preventing collision with workpiece with high rigidity. ● For both machining center and manually operated machines.	—	φ1.0-φ10.0	–	P K N S	1831
GWSS	TiN, FOR DEEP HOLE, CONVOLUTE FLUTE ● Suitable for general and deep hole drilling. It is also effective for shallow hole drilling.	G	φ1.0-φ13.0	-	P M K N	1837
GWSL	TiN, EXTRA LONG ● Suitable for general and deep hole drilling. Suitable for extra deep hole drilling.	G	φ2.0-φ13.0	-	P M K N	1840
LSD	EXTRA LONG ● Widely used for deep hole drilling.	—	φ1.0-φ13.0	–	P K N	1843
For Steel Sheet or Steel Thin Plates						
EPSS	PLATE PAL ● Special cutting edge geometry to prevent through hole burrs.	—	φ2.0-φ13.0	–	P M K N	1847

TAPER SHANK DRILLS

Product name, Shape	Features	Coating	Size range(mm)	Hole Depth (l/d)	Work material	Page
General Drilling						
GTD	TiN ● Original manufacturing and coating technology for improved performance.	G	φ6.0-φ40.0	–	P M K N	1848
TD	TAPER SHANK DRILLS ● For general drilling.	—	φ3.0-φ75.0	–	P M K N	1850
KTD	COBALT HSS ● Suitable for drilling of difficult-to-cut materials.	—	φ5.0-φ50.0	–	P M K N	1854

Product name, Shape	Features	Coating	Size range(mm)	Hole Depth (l/d)	Work material	Page
Deep Hole Drilling						
LTD	EXTRA LONG ● For deep hole drilling.	—	φ6.0-φ40.0	-	P K N	1857
GWTS	G-STEP FREE TAPER DRILLS ● Suitable for general and deep hole drilling. It is also effective for shallow hole drilling.	G	φ6.0-φ32.0	–	P M K N	1860

Product name, Shape	Features	Coating	Size range(mm)	Hole Depth (l/d)	Work material	Page
For Steel Frame						
GTTD	TiN, FOR STEEL FRAME ● Special point geometry for minimal through hole burrs.	G	φ17.0-φ32.0	–	P	1862
TTD	FOR STEEL FRAME ● Special point geometry for minimal through hole burrs.	—	φ17.0-φ32.0	–	P	1864

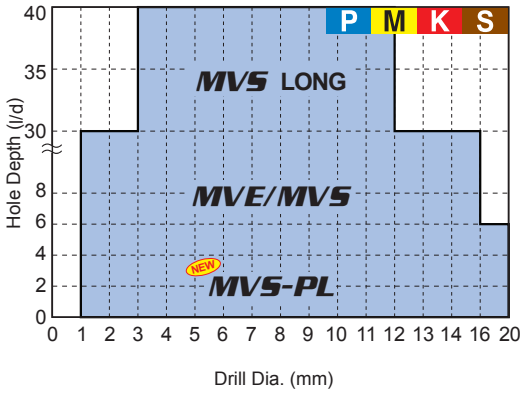
TRIANGULAR SHANK DRILL

Product name, Shape	Features	Coating	Size range(mm)	Hole Depth (l/d)	Work material	Page
For General Purpose Hand Drills(Electric Drill)						
3KD	TRIANGULAR SHANK DRILL ● 3 shank types for portable power tools.	—	φ7.0-φ26.0	–	P K N	1866

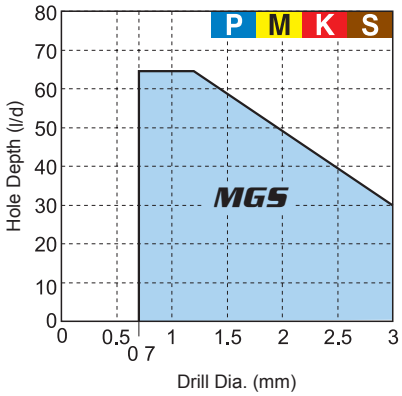
DRILLING APPLICATION RANGE

Carbide solid drills

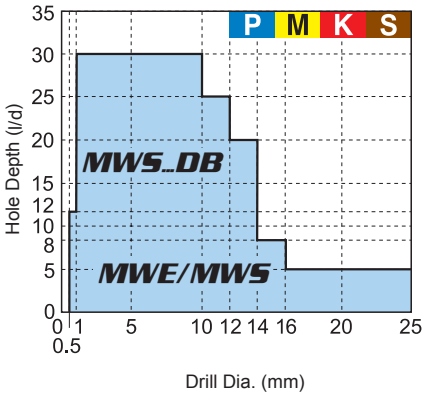
MVE/MVS New generation for general-purpose



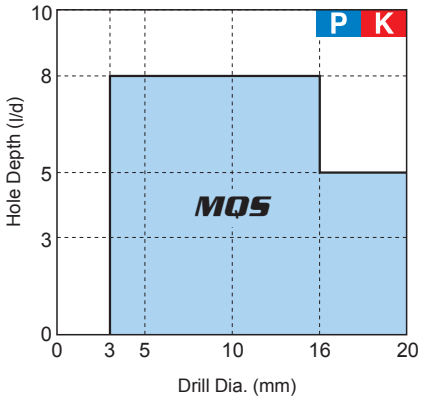
MGS (For small diameter and deep hole)



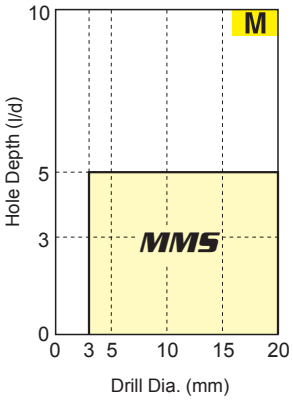
MWE/MWS,MWS...DB (SUPER LONG)



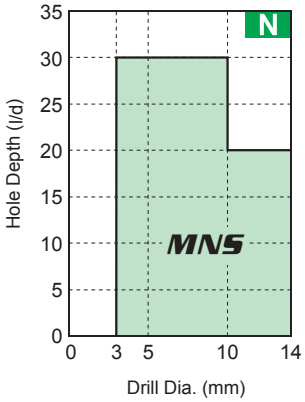
MQS Highly efficient drilling, High-precision
Steel • For high feed cast iron machining



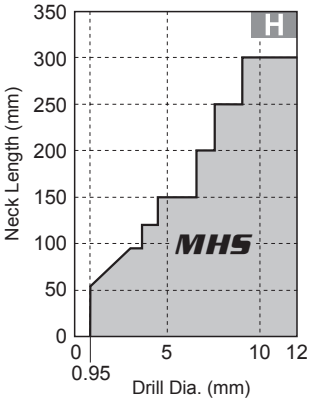
MMS Highly efficient drilling,Long tool life
For machining of stainless steel



MNS Highly efficient drilling
For machining of aluminium alloys



MHS High-precision deep hole
For die & mould machining



Indexable carbide drills

MVS

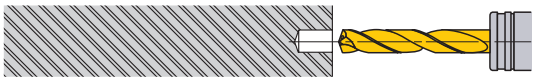
Operational Guidance for the MVS of Small Diameter Long Type Drill (L/D≥10)

Flat Face Drilling ●Drilling a blind hole

1. Drilling a Pilot Hole



①Use a drill with a larger (flatter) point angle than the long type. Use the shortest flute possible.
②Ensure a high precision hole is drilled for the guide.
③Drill depth : Approx DCx1.
(Adjust the pilot hole depth according to the length of the long type drill.)

2. Initial Cutting with the Long Type Drill

①Penetrate the guide hole at low revolution.
(Revolution 1000 min^{-1}, feed rate 0.2—0.3 mm/rev)
②Stop the long type drill 0.5—1 mm short of the guide hole bottom.

3. Drill the Deep Hole

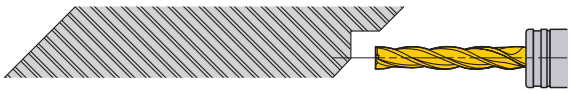
①Start cutting at the recommended speed and feed with a non-peck (continuous feed) cycle.

4. Drill Retraction

①After drilling, lower the cutting revolution about 0.5—1 mm short of the hole end. (Revolution 1000 min^{-1})
②Retract the drill to the pilot hole depth starting point at a feed rate of 3000 mm/min.
③Finally, clear the hole at a cutting speed of 20—30 m/min and feed rate of 0.2—0.3 mm/rev.

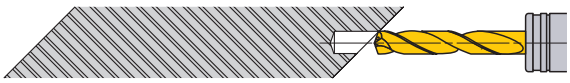
Interruped Drilling ●Drilling and breaking through on irregular faces or angles

1. Spot Facing



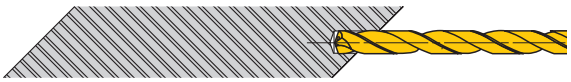
①Machine a flat or the irregular face by using an end mill or slot drill capable of spot facing. Make the spot face diameter the same size as the required deep hole diameter.

2. Drilling a Pilot Hole



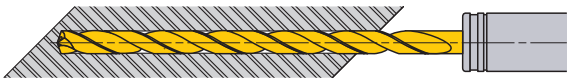
①Use a drill with a larger (flatter) point angle than the long type. Use the shortest flute possible.
②Ensure a high precision hole is drilled for the guide.
③Drill depth : Approx DCx1.
(Adjust the pilot hole depth according to the length of the long type drill.)

3. Initial Cutting with the Long Type Drill



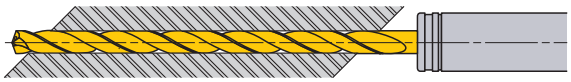
①Penetrate the guide hole at a low revolution.
(Revolution 1000 min^{-1}, feed rate 0.2—0.3 mm/rev)
②Stop the long type drill 0.5—1 mm short of the guide hole bottom.

4. Drill the Deep Hole



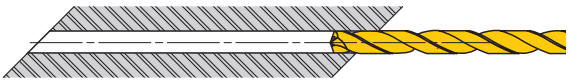
①Start cutting at the recommended speed and feed with a non-peck (continuous feed) cycle.
②Feed as usual until breaking through.

5. Breaking Through



①When breaking through, the cutting edge can be damaged.
②Recommend about half rate of the usual feed rate after breaking through.

6. Drill Retraction



①Finally clear the hole at a revolution speed of 1000 min^{-1} and feed rate of 0.2—0.3mm/rev.
②Retract the drill to the pilot hole depth starting point at a feed rate of 3000mm/min.

MWS

- MWS type bigger than φ5.0 have a recess in the end face.
- MWS drills are suitable for use with shrink fit holders.
- Point Anglel: Type 1 140°for drill diameter φ0.50-2.0 and 145° for φ2.05-2.95.
- Type 3 135°for drill diameter φ0.50-2.0 and 140° for φ2.05-2.95.
- To order non-stocked size of the DB Type(φ 3-φ 14, l/d>10), please provide the following.

Stock status indication:●: Inventory maintained in Japan.▲: This item to be discontinued within two years.□: Non stock, produced to order only.

MWS

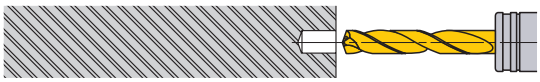
MWS...DB Type Drill(L/D≥10, DC<3) OPERATIONAL GUIDANCE

FLAT FACE DRILLING ●Drilling a blind hole

1. Drilling a pilot hole



①Use the SB type drill.
②Ensure a high precision hole is drilled for the guide.
③Drill depth : Approx 1DC.
(Adjust the pilot hole depth according to the length of the long type drill.)

2. Initial cutting with the long type drill

①Penetrate the guide hole at low revolution. (Revolution 1000min^{-1}, feed rate 0.2–0.3mm/rev)
②Stop the long type drill 0.5–1.0mm short of the guide hole bottom.

3. Drill the deep hole

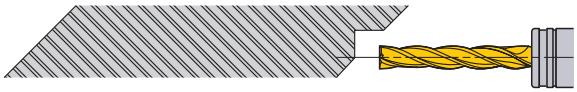
①Start cutting at the recommended speed and feed with a non-peck (continuous feed) cycle.

4. Drill retraction

①After drilling, lower the cutting revolution about 0.5–1.0mm short of the hole end. (Revolution of around 1000min^{-1})
②Retract the drill to the pilot hole depth starting point at a feed rate of 3000mm/min.
③Finally, clear the hole at a cutting speed of 20–30m/min and feed rate of 0.2–0.3mm/rev.

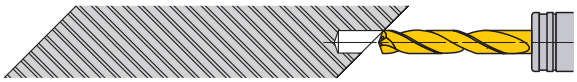
INTERRUPED DRILLING ●Drilling and breaking through on irregular faces or angles

1. Spot facing



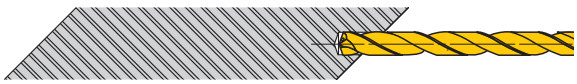
①Machine a flat or the irregular face by using an end mill or slot drill capable of spot facing. Make the spot face diameter the same size as the required deep hole diameter.

2. Drilling a pilot hole



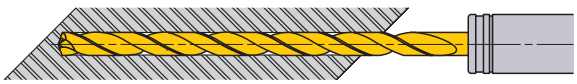
①Use a drill with a larger (flatter) point angle than the long type. TheMWS-SB type is recommended.
②Ensure a high precision hole is drilled for the guide.
③Drill depth : Approx 1DC.
(Adjust the pilot hole depth according to the length of the long type drill.)

3. Initial cutting with the long type drill



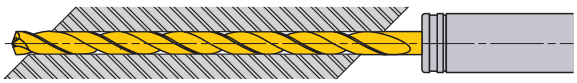
①Penetrate the guide hole at a low revolution. (Revolution 1000min^{-1}, feed rate 0.2–0.3mm/rev)
②Stop the long type drill 0.5–1.0mm short of the guide hole bottom.

4. Drill the deep hole



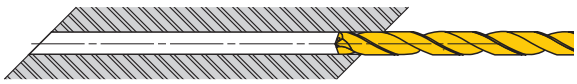
①Start cutting at the recommended speed and feed with a non-peck (continuous feed) cycle.

5. Breaking through



①When breaking through, the cutting edge can be damaged.
②Feed rate should be half the normal feed.

6. Drill retraction



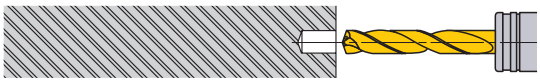
①Finally clear the hole at a revolution speed of 1000min^{-1} and feed rate of 0.2–0.3mm/rev.
②Retract the drill to the pilot hole depth starting point at a feed rate of 3000mm/min.

MWS

OPERATIONAL GUIDANCE FOR THE MWS LONG TYPE DRILL (L/D≥3)

FLAT FACE DRILLING ●Drilling a blind hole

1. Drilling a pilot hole



①Use a drill with a larger (flatter) point angle than the super long type. Mitsubishi type MZE, MZS, MWE or MWS is recommended.
②Use a drill with the same diameter as the deep hole drill.
③Drill depth : Approx 1DC or deeper.
④Ensure a high precision hole is drilled for the guide.

2. Initial cutting with the long type drill

①Penetrate the guide hole at low revolution. (Cutting speed 20—30m/min, feed rate 0.2—0.3mm/rev)
②Stop the long type drill 1—3mm short of the guide hole bottom.

3. Drill the deep hole

①Start cutting at the recommended speed and feed with a non-peck (continuous feed) cycle.

4. Drill retraction

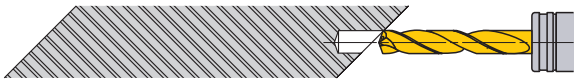
①After drilling, lower the cutting revolution about 1—2mm short of the hole end. (Cutting speed of around 20—30m/min)
②Retract the drill to the pilot hole depth starting point at a feed rate of 3000mm/min.
③Finally, clear the hole at a cutting speed of 20—30m/min and feed rate of 0.2—0.3mm/rev.

INTERRUPED DRILLING ●Drilling and breaking through on irregular faces or angles

1. Spot facing

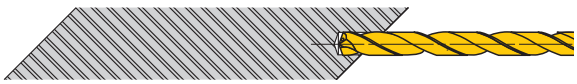
①Machine a flat or the irregular face by using an end mill or slot drill capable of spot facing. Make the spot face diameter the same size as the required deep hole diameter.

2. Drilling a pilot hole



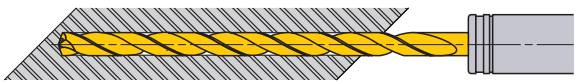
①Use a drill with a larger (flatter) point angle than the super long type. Mitsubishi type MZE, MZS, MWE or MWS is recommended.
②Use a drill with the same diameter as the deep hole drill.
③Drill depth : Approx 1DC or deeper.
④Ensure a high precision hole is drilled for the guide.

3. Initial cutting with the long type drill



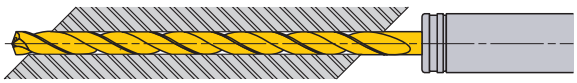
①Penetrate the guide hole at a low revolution. (Cutting speed 20—30m/min, feed rate 0.2—0.3mm/rev)
②Stop the long type drill 1—3mm short of the guide hole bottom.

4. Drill the deep hole



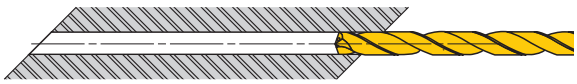
①Start cutting at the recommended speed and feed with a non-peck (continuous feed) cycle.

5. Breaking through



①When breaking through, the cutting edge can be damaged.
②A feed rate of 0.05—0.1mm/rev is recommended.

6. Drill retraction



①Finally clear the hole at a cutting speed of 20—30m/min and feed rate of 0.2—0.3mm/rev.
②Retract the drill to the pilot hole depth starting point at a feed rate of 3000mm/min.

- Spindle through & high pressure coolant system is recommended to make stable holes.
- Emulsion type of water coolant is recommended.
- Please reduce the revolution when using non-water-soluble cutting fluid.

- For stable machining, internal coolant supply with high pressure is recommended.
- Emulsion type of water coolant is recommended.
- Recommended cutting conditions are for machining under the conditions of favourable machining environment and coolant. Please lower the cutting conditions if there is a problem in the rigidity of machine and workpiece, and coolant property or discharge amount.
- When looking at the coating the color can vary depending on the direction of viewing. This does not have any effect on the performance of the drill.

- MNS drills are suitable for use with shrink fit holders.
- 4.5 or smaller diameter drills are designed with 2 colant holes.

Stock status indication:●: Inventory maintained in Japan.▲: This item to be discontinued within two years.□: Non stock, produced to order only.

- When using the drill with a length over l/d 10, it is necessary to use a prep holes as a guide. (If no prep-hole is used then drill breakage can occur.)
- For pilot hole drilling, Mitsubishi Materials MNS-LB, MAE-MB or MAS-MB drill is recommended.

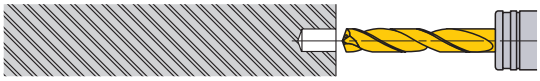
- For pilot hole drilling, Mitsubishi Materials MNS-LB, MAE-MB or MAS-MB drill is recommended.

MNS

OPERATIONAL GUIDANCE FOR MNS...DB DRILLS

FLAT FACE DRILLING ●Drilling a blind hole

1. Drilling a pilot hole

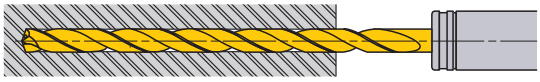


①Use a drill with a larger (flatter) point angle than the super long type. Mitsubishi type MNS-LB, MAE-MB or MAS-MB drill is recommended.
②Ensure a high precision hole is drilled for the guide.
③Drill depth : Approx 1DC.
(Adjust the pilot hole depth according to the length of the long type drill.)

2. Initial cutting with the long type drill

①Penetrate the guide hole at low revolution. (Cutting speed 20—30m/min, feed rate 0.2—0.3mm/rev)
②Stop the long type drill 1—3mm short of the guide hole bottom.

3. Drill the deep hole



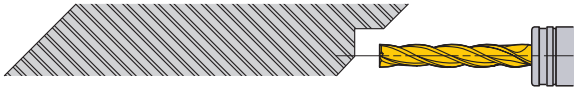
①Start cutting at the recommended speed and feed with a non-peck (continuous feed) cycle.

4. Drill retraction

①After drilling, lower the cutting revolution about 1—2mm short of the hole end. (Cutting speed of around 20—30m/min)
②Retract the drill to the pilot hole depth starting point at a feed rate of 3000mm/min.
③Finally, clear the hole at a cutting speed of 20—30m/min and feed rate of 0.2—0.3mm/rev.

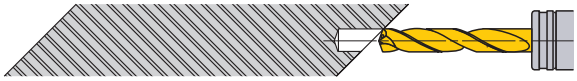
INTERRUPED DRILLING ●Drilling and breaking through on irregular faces or angles

1. Spot facing



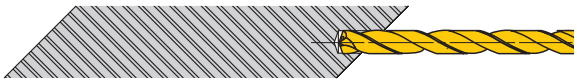
①Machine a flat or the irregular face by using an end mill or slot drill capable of spot facing. Make the spot face diameter the same size as the required deep hole diameter.

2. Drilling a pilot hole



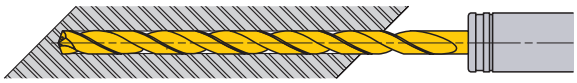
①Use a drill with a larger (flatter) point angle than the super long type. Mitsubishi type MNS-LB, MAE-MB or MAS-MB drill is recommended.
②Ensure a high precision hole is drilled for the guide.
③Drill depth : Approx 1DC.
(Adjust the pilot hole depth according to the length of the long type drill.)

3. Initial cutting with the long type drill



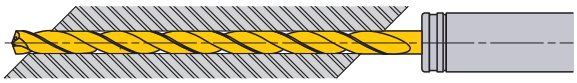
①Penetrate the guide hole at a low revolution. (Cutting speed 20—30m/min, feed rate 0.2—0.3mm/rev)
②Stop the long type drill 1—3mm short of the guide hole bottom.

4. Drill the deep hole



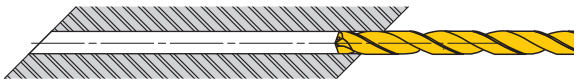
①Start cutting at the recommended speed and feed with a non-peck (continuous feed) cycle.

5. Breaking through



①When breaking through, the cutting edge can be damaged.
②A feed rate of 0.05—0.1mm/rev is recommended.

6. Drill retraction



①Finally clear the hole at a cutting speed of 20—30m/min and feed rate of 0.2—0.3mm/rev.
②Retract the drill to the pilot hole depth starting point at a feed rate of 3000mm/min.

MHS

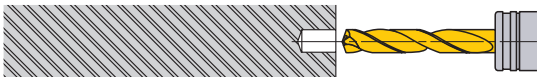
- When using the drill with a length over l/d 10, it is necessary to use a prep holes as a guide.(If no prephole is used then drill breakage can occur)
- Setting of the diameter tolerance differs from general-purpose drills. MHS shortest flute drills are recommended for prep hole machining.
- MHS drills are suitable for use with shrink fit holders.
- Use the shortest type in the respective diameter as a pilot drill.

MHS

OPERATIONAL GUIDANCE FOR THE MHS LONG TYPE DRILL (L/D≥10)

FLAT FACE DRILLING ●Drilling a blind hole

1. Drilling a pilot hole

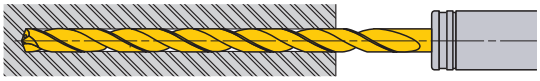


①Use a drill with a larger (flatter) point angle than the super long type. Use the shortest flute possible.
②Ensure a high precision hole is drilled for the guide.
③Drill depth : Approx 1DC.
(Adjust the pilot hole depth according to the length of the long type drill.)

2. Initial cutting with the long type drill

①Penetrate the guide hole at low revolution. (Revolution 1000min^{-1}, feed rate 0.2—0.3mm/rev)
②Stop the long type drill 1—3mm short of the guide hole bottom.

3. Drill the deep hole



①Start cutting at the recommended speed and feed with a non-peck (continuous feed) cycle.

4. Drill retraction

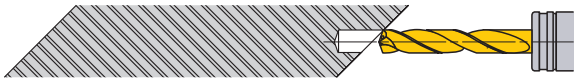
①After drilling, lower the cutting revolution about 0.5—1mm short of the hole end. (Revolution of around 1000min^{-1})
②Retract the drill to the pilot hole depth starting point at a feed rate of 3000mm/min.
③Finally, clear the hole at a cutting speed of 20—30m/min and feed rate of 0.2—0.3mm/rev.

INTERRUPED DRILLING ●Drilling and breaking through on irregular faces or angles

1. Spot facing

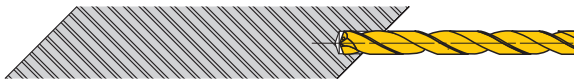
①Machine a flat or the irregular face by using an end mill or slot drill capable of spot facing. Make the spot face diameter the same size as the required deep hole diameter.

2. Drilling a pilot hole



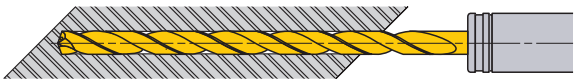
①Use a drill with a larger (flatter) point angle than the super long type. Use the shortest flute possible.
②Ensure a high precision hole is drilled for the guide.
③Drill depth : Approx 1DC.
(Adjust the pilot hole depth according to the length of the long type drill.)

3. Initial cutting with the long type drill



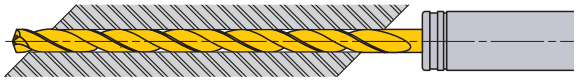
①Penetrate the guide hole at a low revolution. (Revolution 1000min^{-1}, feed rate 0.2—0.3mm/rev)
②Stop the long type drill 0.5—1mm short of the guide hole bottom.

4. Drill the deep hole



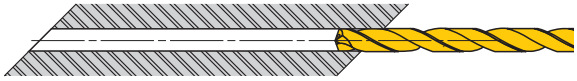
①Start cutting at the recommended speed and feed with a non-peck (continuous feed) cycle.

5. Breaking through



①When breaking through, the cutting edge can be damaged.
②Lower the feed rate when penetrating.

6. Drill retraction



①Finally clear the hole at a cutting speed of 20—30m/min and feed rate of 0.2—0.3mm/rev.
②Retract the drill to the pilot hole depth starting point at a feed rate of 3000mm/min.

- When drilling holes up to ø0.3mm, the use of a spot drill is recommended.(Order number : MSP0300SB, Cutting conditions : See next page.)
- Change cutting conditions depending on your machine and workpiece rigidity.
- When machining holes over 5DC, reduce the step stated above.
- The use of water-soluble fluid(diluted by 20 times)is recommended for drilling under the cutting conditions above. Lower the revolutions if you use oil fluid or mist.

- Please use a machine with a high accuracy spindle.
- A collet chuck is recommended to maintain shank condition.
- Use emulsion as a cutting fluid.

14.0	340	0.07	230	0.05
16.0	300	0.07	200	0.05

- Use rigid machines.
- A collet chuck is recommended to maintain shank condition.
- Use emulsion as a cutting fluid.
- Recommended depth of drilling is 3DC(DC:drill diameter) under these cutting conditions.

MZE

MZS

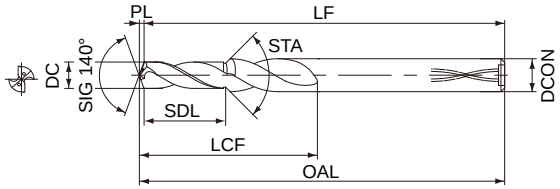
Type1



Type2

—	3<DC≦6	6<DC≦10	10<DC≦18
	0 −0.018	0 −0.022	0 −0.027
MZE	0 −0.018	0 −0.022	0 −0.027
MZS	0 −0.008	0 −0.009	0 −0.011

- MZS type bigger than φ5.0 have a recess in the end face.
- Spot face drilling is not possible (chamfering only).
- For metric coarse thread.
- MZS type also available for shrink fit holder.

Stock status indication:●: Inventory maintained in Japan.▲: This item to be discontinued within two years.□: Non stock, produced to order only.

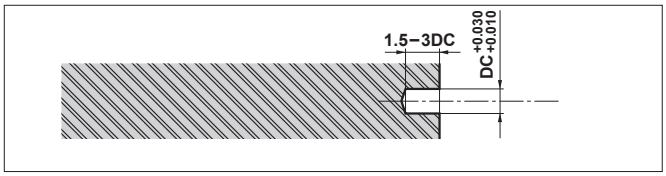
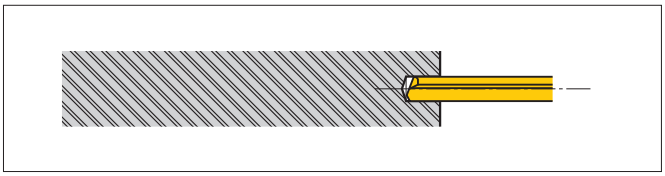
SPECIAL APPLICATION NOTES

- For safety and success, high pressure coolant is required.
  (Minimum coolant pressure=1,000PSI)
- Coolant filter must be less than 5 microns.
  Fine filtration is necessary to prevent blockage of the coolant holes.
- A pilot hole or guide bushing is required.

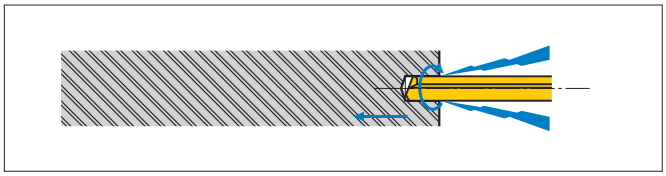
HOW TO USE



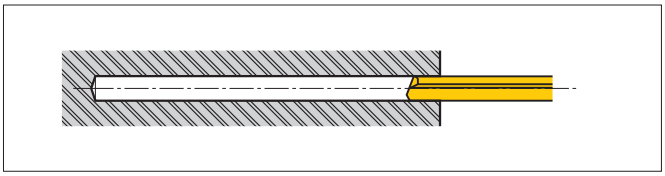
1. Pilot hole drilling.
   (Mitsubishi's MZE, MZS, MWE or MWS is recommended.)



2. Drill is inserted into the pilot hole with the MSG drill rotation stopped or rotating CCW at 300rpm or less.
   ● UP to 1-2mm before hole bottom.



3. Coolant is turned ON, raise cutting speed and feed to the recommended cutting condition.



4. Return to "Pos 2" after drilling end, coolant turned OFF and drill rotation is stopped.

- When drilling very hard work materials, reduce the feed.
- Use water soluble coolant or grinding fluid when working.
- When drilling deep holes, moderate the cutting conditions.
- The revolution can be increased by using a high speed spindle.

- Depending on the type of machine, it is possible to apply cutting speeds over 20000min^{-1}.
- Use water soluble coolant or grinding fluid when working.
- The intermediate diameter revolution is not tabulated. It is matched to the large diameter side and closest drill diameter conditions or by calculating the cutting speed of the closest drill diameter. Set the feedrate per revolution to a suitable value with the recommended feedrate of the closest drill diameter as the standard.

- Please reduce the revolution and feed rate depending on the drilling situation when the installation of workpiece or machine lacks rigidity.
- Please use a collet type drill chuck or a milling chuck.
- Use sufficient cutting fluid.
- VAPDM is recommended when the work material hardness exceeds 30HRC.
- WSTAR drill (MVE, MVS, MMS) are recommended for precipitation hardening stainless steel (JIS-SUS630/ISOL-No58X5CrNiCuNb16-4/ASTM-S17400, JIS-SUS631/DIN-X7CrNiAl177/ASTM-S17700)
- When drilling holes greater than 4 x drill diameter hole depths, please use a peck feed.
- The above-mentioned cutting condition is standard when using water-soluble cutting fluid. Please reduce the revolution when using non-water-soluble cutting fluid.
- The intermediate diameter revolution is not tabulated. It is matched to the large diameter side and closest drill diameter conditions or by calculating the cutting speed of the closest drill diameter. Set the feedrate per revolution to a suitable value with the recommended feedrate of the closest drill diameter as the standard.

- Please reduce the revolution and feed rate depending on the drilling situation when the installation of workpiece or machine lacks rigidity.
- Please use a collet type drill chuck or a milling chuck.
- Use sufficient cutting fluid.
- VAPDSSUS are recommended for austenitic stainless steels(AISI 304).
- When drilling holes greater than 4 x drill diameter hole depths, please use a peck feed.
- The above-mentioned cutting condition is standard when using water-soluble cutting fluid. Please reduce the revolution when using non-water-soluble cutting fluid.

- Please reduce the revolution and feed rate depending on the drilling situation when the installation of workpiece or machine lacks rigidity.
- Please use a collet type drill chuck or a milling chuck.
- Use sufficient cutting fluid.
- VAPDMSUS are recommended for austenitic stainless steels(AISI 304).
- When drilling holes greater than 4 x drill diameter hole depths, please use a peck feed.
- The above-mentioned cutting condition is standard when using water-soluble cutting fluid. Please reduce the revolution when using non-water-soluble cutting fluid.

VAPDSSUS VIOLET DRILLS

Short, High precision, For stainless steel

- Please reduce the revolution and feed rate depending on the drilling situation when the installation of workpiece or machine lacks rigidity.
- Please use a collet type drill chuck or a milling chuck.
- Use sufficient cutting fluid.
- WSTAR drill (MVE, MVS,MMS)are recommended for precipitation hardening stainless steel(JIS-SUS630/ISOL-No58X5CrNiCuNb16-4/ASTM-S17400, JIS-SUS631/DIN-X7CrNiAl177/ASTM-S17700)
- When drilling holes greater than 4 x drill diameter hole depths, please use a peck feed.
- The above-mentioned cutting condition is standard when using water-soluble cutting fluid. Please reduce the revolution when using non-water-soluble cutting fluid.

- Please reduce the revolution and feed rate depending on the drilling situation when the installation of workpiece or machine lacks rigidity.
- Please use a collet type drill chuck or a milling chuck.
- Use sufficient cutting fluid.
- WSTAR drill (MVE, MVS,MMS)are recommended for precipitation hardening stainless steel(JIS-SUS630/ISOL-No58X5CrNiCuNb16-4/ASTM-S17400, JIS-SUS631/DIN-X7CrNiAl177/ASTM-S17700)
- When drilling holes greater than 4 x drill diameter hole depths, please use a peck feed.
- The above-mentioned cutting condition is standard when using water-soluble cutting fluid. Please reduce the revolution when using non-water-soluble cutting fluid.

- The above cutting conditions are for drilling 3xDC hole depths without a pilot hole. When drilling holes smaller than 1xDC hole depths, it is possible to increase the revolution speed by 20%.
- Drilling without a pilot hole is recommended. If there is a pilot hole, chips are not broken. Use a pick feed when chip breaking is necessary.
- For counter boring of a sloped face, a carbide end mill is recommended.
- When machining austenitic stainless steels(JIS SUS304,SUS316),set the revolution at 40%-70% and the feed rate 40%-60%.
- Please use a collet type drill chuck or a milling chuck.
- Please reduce the revolution and feed rate depending on the drilling situation when the installation of workpiece or machine lacks rigidity.
- Use sufficient cutting fluid.
- The above-mentioned cutting condition is standard when using water-soluble cutting fluid. Please reduce the revolution when using non-water-soluble cutting fluid.

- Please reduce the revolution depending on drilling situation when the application lacks rigidity.
- Please use step drilling and reduce the cutting conditions in the case when the drilling depth exceeds 3DC(DC:drill diameter).
- The above-mentioned cutting condition is standard when using water-soluble cutting fluid. Please reduce the revolution when using non-water-soluble cutting fluid.

- Please reduce the cutting conditions when drilling a deep hole.
- This table only shows standard cutting conditions with water-soluble cutting fluids. Please make corrections or adjustments depending on the application.

Reduction rate of cutting conditions for hole drilling

Drilling depth	Reduction rate of cutting speed	Reduction rate of feed
4DC	10%	10%
5DC	10%	15%
6DC	20%	20%
7DC	20%	20%

Drilling depth	Reduction rate of cutting speed	Reduction rate of feed
8DC	30%	20%
10DC	30%	25%
15DC	40%	30%
20DC	40%	45%

- The intermediate diameter revolution is not tabulated. It is matched to the large diameter side and closest drill diameter conditions or by calculating the cutting speed of the closest drill diameter. Set the feedrate per revolution to a suitable value with the recommended feedrate of the closest drill diameter as the standard.
- Lower the revolution and feedrate accordingly, when the work material is not rigid or there are restrictions on the machine.
- When drilling holes greater than 3 x drill diameter hole depths, please use a peck feed.
- The cutting conditions mentioned above are standard with the tool protrusion length was made 2 times the flute length.
- Use of water-soluble cutting fluid is recommended. Please reduce the revolution when using non-water-soluble cutting fluid.
- Use sufficient cutting fluid. Please reduce the revolution when insufficient cutting fluid.
- When using a guide bush, please confirm the flute length > A. In case of short flute length, please conduct machining without the bush. And, when not being able to dismount the bush, please use LSD or GWSL.

- Please reduce the cutting conditions when drilling a deep hole.
- This table only shows standard cutting conditions with water-soluble cutting fluids. Please make corrections or adjustments depending on the application.

Reduction rate of cutting conditions for hole drilling

Drilling depth	Reduction rate of cutting speed	Reduction rate of feed
4DC	10%	10%
5DC	10%	15%
6DC	20%	20%
7DC	20%	20%

Drilling depth	Reduction rate of cutting speed	Reduction rate of feed
8DC	30%	20%
10DC	30%	25%
15DC	40%	30%
20DC	40%	45%

- Please reduce the cutting conditions when drilling a deep hole.
- This table only shows standard cutting conditions with water-soluble cutting fluids. Please make corrections or adjustments depending on the application.

Reduction rate of cutting conditions for hole drilling

Drilling depth	Reduction rate of cutting speed	Reduction rate of feed	Drilling depth	Reduction rate of cutting speed	Reduction rate of feed
4DC	10%	10%	8DC	30%	20%
5DC	10%	15%	10DC	30%	25%
6DC	20%	20%	15DC	40%	30%
7DC	20%	20%	20DC	40%	45%

- Please reduce the cutting conditions when drilling a deep hole.
- This table only shows standard cutting conditions with water-soluble cutting fluids. Please make corrections or adjustments depending on the application.

Reduction rate of cutting conditions for hole drilling

Drilling depth	Reduction rate of cutting speed	Reduction rate of feed
4DC	10%	10%
5DC	10%	15%
6DC	20%	20%
7DC	20%	20%

Drilling depth	Reduction rate of cutting speed	Reduction rate of feed
8DC	30%	20%
10DC	30%	25%
15DC	40%	30%
20DC	40%	45%

- Please reduce the cutting conditions when drilling a deep hole.
- This table only shows standard cutting conditions with water-soluble cutting fluids. Please make corrections or adjustments depending on the application.

Reduction rate of cutting conditions for hole drilling

Drilling depth	Reduction rate of cutting speed	Reduction rate of feed
4DC	10%	10%
5DC	10%	15%
6DC	20%	20%
7DC	20%	20%

Drilling depth	Reduction rate of cutting speed	Reduction rate of feed
8DC	30%	20%
10DC	30%	25%
15DC	40%	30%
20DC	40%	45%

- Please reduce the cutting conditions when drilling a deep hole.
- This table only shows standard cutting conditions with water-soluble cutting fluids. Please make corrections or adjustments depending on the application.

Reduction rate of cutting conditions for hole drilling

Drilling depth	Reduction rate of cutting speed	Reduction rate of feed	Drilling depth	Reduction rate of cutting speed	Reduction rate of feed

- Please reduce the cutting conditions when drilling a deep hole.
- This table only shows standard cutting conditions with water-soluble cutting fluids. Please make corrections or adjustments depending on the application.

Reduction rate of cutting conditions for hole drilling

Drilling depth	Reduction rate of cutting speed	Reduction rate of feed
4DC	10%	10%
5DC	10%	15%
6DC	20%	20%
7DC	20%	20%

Drilling depth	Reduction rate of cutting speed	Reduction rate of feed
8DC	30%	20%
10DC	30%	25%
15DC	40%	30%
20DC	40%	45%

- Please reduce the cutting conditions when drilling a deep hole.
- This table only shows standard cutting conditions with water-soluble cutting fluids. Please make corrections or adjustments depending on the application.

Reduction rate of cutting conditions for hole drilling

Drilling depth	Reduction rate of cutting speed	Reduction rate of feed
4DC	10%	10%
5DC	10%	15%
6DC	20%	20%
7DC	20%	20%

Drilling depth	Reduction rate of cutting speed	Reduction rate of feed
8DC	30%	20%
10DC	30%	25%
15DC	40%	30%
20DC	40%	45%

(Note 1) Drills in the intermediate drill diameter range are produced to order only.
(Note 2) For ordering an intermediate diameter, please enter the diameter (DC) into the 4-digit space□□□□in the nominal designation.
(Ex. UP20M BRA2530S32 for a diameter of ϕ25.30mm)
(Note 3) Please contact us regarding special designs.
(Note 4) Please contact us for any geometry that is not in this catalogue (e.g. drills with chamfered cutting edges can be made to order).

● : Inventory maintained in Japan. □ : Non stock, produced to order only.

(Note 1) Drills in the intermediate drill diameter range are produced to order only.
(Note 2) For ordering an intermediate diameter, please enter the diameter (DC) into the 4-digit space□□□□in the nominal designation.
(Ex. STi40T BRL2530S32 for a diameter of ϕ25.30mm)
(Note 3) Please contact us regarding special designs.
(Note 4) Please contact us for any geometry that is not in this catalogue (e.g. drills with chamfered cutting edges can be made to order).

● : Inventory maintained in Japan. □ : Non stock, produced to order only.

HONE WIDTH

If an insert with honing other than standard is needed, please order using the symbols below.

(Insert Order Number)

S T A W N 1 0 0 0 T ◌

- S T A W: STAW Product Name
- N: N : General Use / K : For Cast Iron
- 1 0 0 0: Insert Diameter
- T: Honing Symbol
- ◌: Honing Type

(Honing Standard)

Honing Type	Hone Width (mm)
F	0
G	0.02—0.05
H	0.05—0.10
-	0.10—0.15
K	0.15—0.20
S	0.20—0.25
M	0.25—0.30

RECOMMENDED CUTTING CONDITIONS

	Work Material	Drill Diameter	ϕ10.0—ϕ12.9		ϕ13.0—ϕ13.9		ϕ14.0—ϕ15.4		ϕ15.5—ϕ18.4	
		Conditions / Hardness	Cutting Speed (m/min)	Feed (mm/rev)	Cutting Speed (m/min)	Feed (mm/rev)	Cutting Speed (m/min)	Feed (mm/rev)	Cutting Speed (m/min)	Feed (mm/rev)
P	Mild Steel	≤180HB	80 (60—100)	0.20 (0.15—0.25)	90 (70—110)	0.25 (0.20—0.30)	100 (80—120)	0.30 (0.25—0.35)	100 (80—120)	0.35 (0.25—0.40)

M	Stainless Steel	≤200HB	40 (30—50)	0.13 (0.10—0.16)	50 (40—60)	0.15 (0.12—0.18)	60 (50—70)	0.17 (0.14—0.20)	60 (50—70)	0.17 (0.14—0.20)
K	Gray Cast Iron	Tensile Strength ≤350MPa	80 (60—100)	0.20 (0.15—0.25)	90 (70—110)	0.25 (0.20—0.30)	100 (80—120)	0.30 (0.25—0.35)	120 (80—140)	0.45 (0.35—0.55)
K	Ductile Cast Iron	Tensile Strength ≤450MPa	70 (60—90)	0.20 (0.15—0.25)	80 (60—100)	0.25 (0.20—0.30)	90 (70—110)	0.30 (0.25—0.35)	100 (80—120)	0.35 (0.25—0.40)

(Note 1) When using a drill for 1.5DC depth of hole, it is possible to increase the feed rate by approx. 20%.
(Note 2) When using the 8DC type holder, reduce the cutting speed by approx. 20%.
(Note 3) When using the 8DC type holder, it is recommended to drill a pilot guide hole.
(Note 4) For stainless steel, please use internal coolant. (Mist & MQL are not recommended).

NOTES ON USE

INSERT INSTALLATION

1. Before inserting the insert into the holder, ensure that there are no foreign objects or dirt in the holder slot or slit. If there are any foreign objects or dirt, use compressed air to remove them.

2. Use the provided wrench to loosen the inner screw to open the tip of the holder, then put the insert into the holder slot as shown in figure 1.
   *Ensure that the wrench is firmly in contact with the base of the inner screw head when tightening.

3. After the insert has been set in the holder slot, tighten the inner screw while holding the insert lightly as shown in figure 2 to securely clamp and locate the insert.
   *Ensure that the wrench is firmly in contact with the base of the inner screw head when tightening.

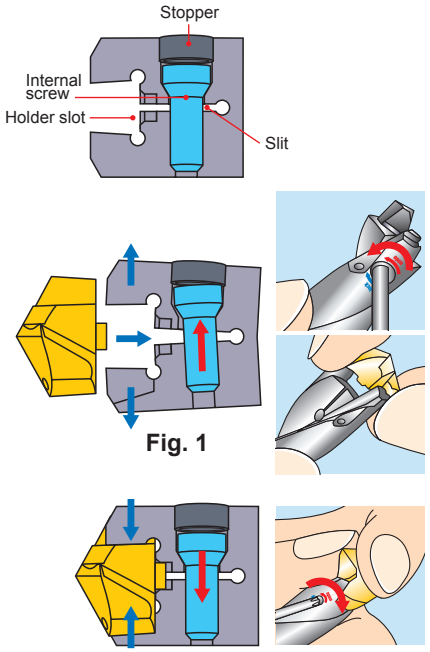

Fig. 1

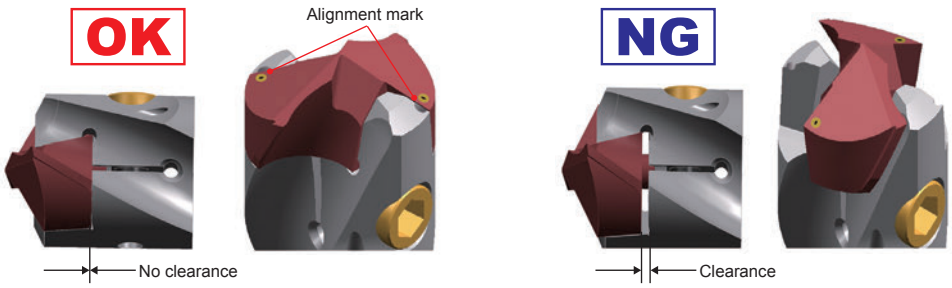
Fig. 2

Tighten the clamp screw according to the torque below.

Drill Diameter (mm)	Clamp Torque N · m
10 －12.9	1
13 －15.4	2
15.5－18.4	2.5

4. Check there is no gap between the bottom of the insert and holder slot.



(Note) Poor or incorrect clamping of inserts can cause poor drilling performance and/or drill breakage.
Therefore ensure that the alignment marks on both the body and insert are aligned when setting.
When machining, use safety guards and goggles.

K	Gray Cast Iron	Tensile Strength ≤350MPa	130 (80−150)	0.35 (0.25−0.40)	140 (90−160)	0.35 (0.25−0.40)	140 (90−160)	0.40 (0.30−0.45)
K	Ductile Cast Iron	Tensile Strength ≤450MPa	90 (60−100)	0.30 (0.25−0.35)	100 (80−110)	0.30 (0.25−0.35)	100 (80−110)	0.30 (0.25−0.35)

(Note 1) When using the 8DC type holder, reduce the cutting speed by approx. 20%.
(Note 2) When using the 8DC type holder, it is recommended to drill a pilot guide hole.
(Note 3) H type honing is recommended when machining mild steel and stainless steel.

HONE WIDTH

If an insert with honing other than standard is needed, please order using the symbols below.

(Insert Order Number)

NOTES ON USE

INSERT INSTALLATION

●Loosen the clamp screw to install the insert.
●Correctly mesh the insert and the holder serrations, then slide the insert to the bottom of the slot.
●Fasten the clamp screw using the torque wrench provided while holding the insert lightly as shown. (Figure 1)
●Check there is no gap between the bottom of the insert and holder. (Figure 2)

Tighten the clamp screw according to the torque below.

Drill Diameter (mm)	Clamp Torque (N · m)
14—15	2.0
16—18	2.0
19—21	3.5
22—24	5.5
25—27	8.5
28—30	12.0

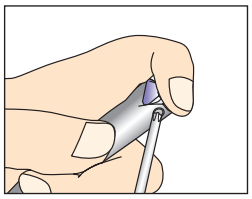

Fig. 1

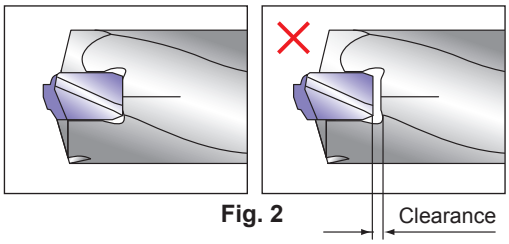

Fig. 2

INSERT REPLACEMENT

●Thouroughly clean the serrations of the holder before installing a new insert.
Remove heavy dirt in the holder serrations by using the cleaning plate provided.

Note 1) Reduce the cutting speed by 30% when VP15TF is used as an outer insert.
Note 2) L/D=3 is the recommended maximum depth when only external coolant is used.
Note 3) Internal through coolant is highly necessary when drilling stainless steel.

MVX

vc = Cutting Speed (Min.–Max.)
fr = Feed Rate (Min.–Max.)

It does not correspond to the shank diameter ø50mm.

∗Increase : Size of the increase in the cutting diameter.

Guideline for Selecting a JUST FIT SLEEVE

Desired = (Drillø+ Increase of JFS) + 0.1mm

(Eg.) Desired diameter is 20.3mm (oversize is taken as 0.1mm).

ø20.3=(MVX2000 X ◌F25+JFS3225-20)+0.1

20mm Drill — Using JFS an Increase of 0.2mm. — Oversize

<Tool Selected>
MVX : **MVX2000 X ◌F25**
JUST FIT SLEEVE [JFS]
: **JFS3225-20**

(Note) Oversize can vary due to the cutting conditions used, please use the above as a guideline.

Ordering the JUST FIT SLEEVE

● **Purchasing Method 1**
Oversize can vary due to the cutting conditions used. Therefore it is recommended to purchase as a set. When placing an order, please use the set order number. (5 sleeves/set)

● **Purchasing Method 2**
It is possible to order individually. When placing an order, please use the order number.

● **: Inventory maintained in Japan.**

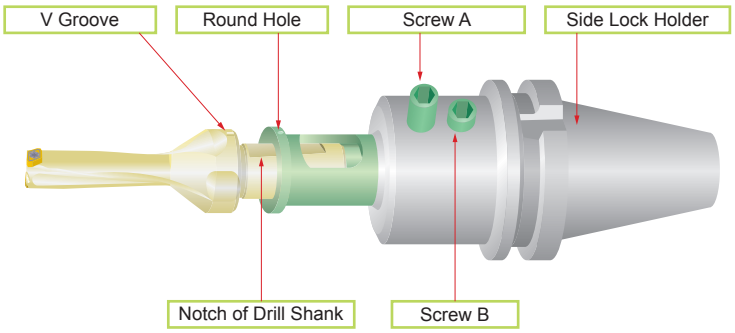
TAF

APPLICATION OF JUST FIT SLEEVE

1 When inserting the drill into the side lock holder, aligin the V groove on the outer peripheral edge of the drill flange, as well as the round holes of the outer peripheral edge of the sleeve flange and the screws of the side lock holder for fixing the drill. (If the drill does not have a V groove, align the notch of the drill shank with the round holes of the sleeve.)

2 Insert screws A of the side lock holder directly to the open window of the sleeve and fix the drill. Tighten screw B to a degree so as not to damage the sleeve.

(Note)
- Fine adjustments cannot be made for the diameter
- Cannot be used with collect chuck type holders.

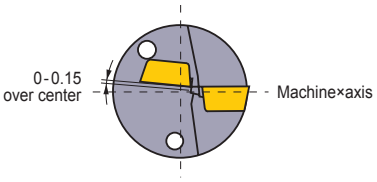


APPLICATION OF MVX TYPE DRILL

●Use on a Lathe

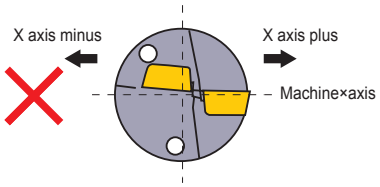
(1)The outer insert and machine X axis must be set parallel. The drill is designed so that when the drill center and the machine spindle center are aligned then the inner insert height is 0-0.15mm lower.

*The inner insert may fracture if the center height of the inner insert is higher than the machine X axis.

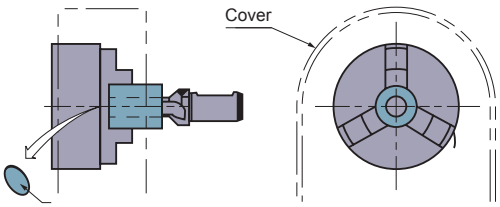


(2)By off setting it is possible to adjust the hole diameter. To do this adjust in the positive X axis direction (hole oversize direction). For the amount of possible adjustment please refer to the dimensions list.

*It is not recommended to adjust in the negative X axis direction as this may lead to drill interference with the hole.



(3)When through hole drilling on a lathe the disc produced by the drill exiting the workpiece may be expelled at high velocity.
To reduce the danger of injury or damage a cover guard is highly recommended.



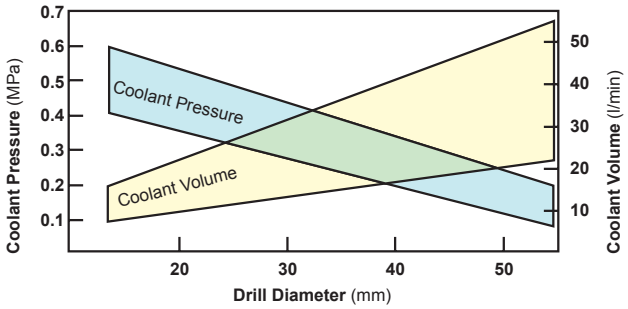
TAF

APPLICATION OF TAF TYPE DRILL

●Please ensure the highest rigidity possible exists in both machine set up and workholding.

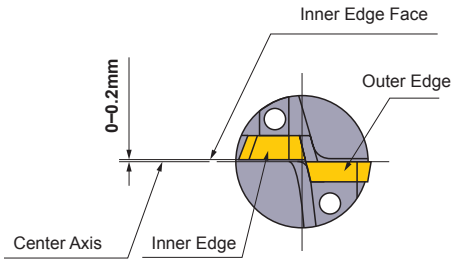
●Refer to the following graph on the right for coolant pressure and volume. Coolant is an important factor in the efficient use of these drills.

●Cannot be used for stack drilling.
In common with many indexable insert drills, these drills produce a round disc on exit which unless evacuated may cause the drill to fracture.

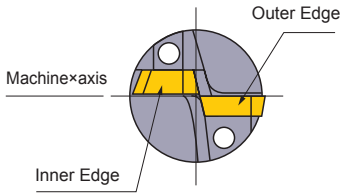


●Use on a Lathe

(1)The inner cutting edge must be positioned between 0—0.2mm over center.

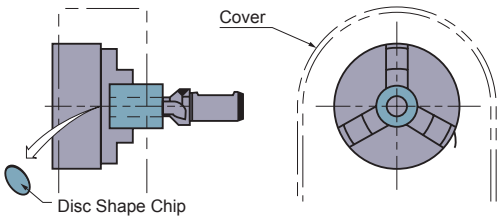


(2)To adjust the hole diameter by off-setting the drill, the outer cutting edge and machine axis must be set parallel.



(3)When producing an oversize hole.
The drill offset should be no more than 2% of the diameter.
It is not possible to produce an undersized hole.

(4)When through hole drilling on a lathe the disc produced by the drill exiting the workpiece may be expelled at high velocity.
To reduce the danger of injury or damage a cover guard is highly recommended.



Memo

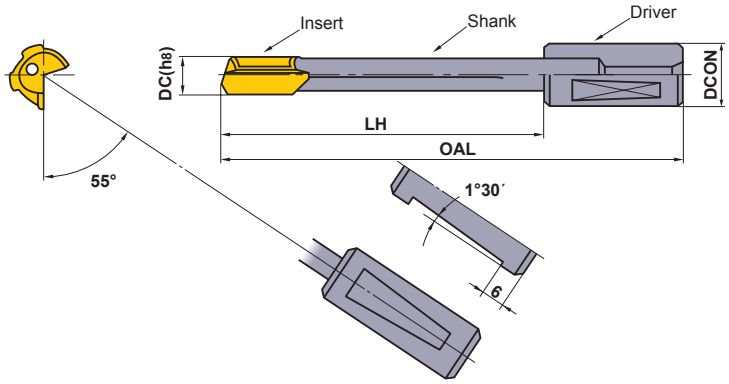
GUN DRILL

BRAZED TYPE

Technical Info >> 1997

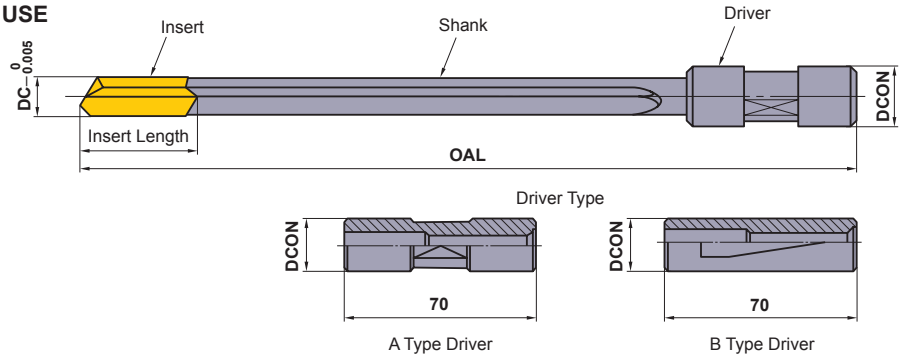
●GUN DRILL FOR MACHINING CENTER

- ●Suitable for deep hole drilling on Machining Center.
- ●Drill Diameter :ϕ6.0—ϕ20.0



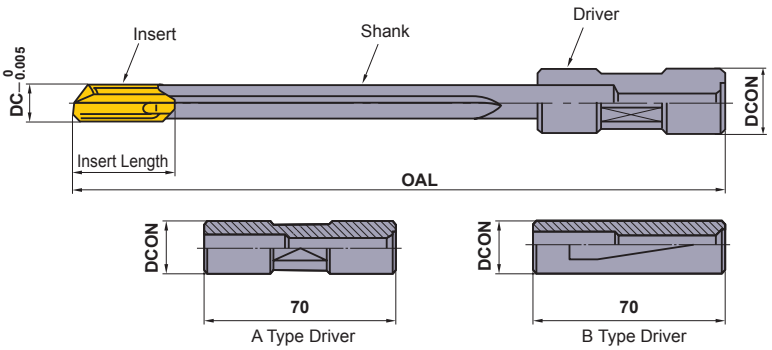
●GUN DRILL FOR GENERAL USE

- ●Suitable for deep hole drilling.
- ●Drill Diameter : ϕ2.0—ϕ30.3



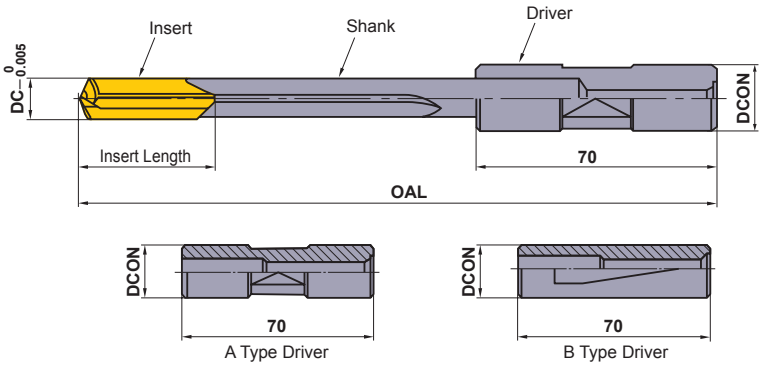
●SAMMIKA GUN DRILL

- ●The unique uneven cutting edge shape displays excellent chip dividing and enables high feed machining.
- ●Drill Diameter : ϕ5.0—ϕ30.3



●ARROW JET GUN DRILL

- ●Excellent chip discharge due to the double-tooth design and chip breaker.
- ●Drill Diameter : ϕ6.0—ϕ30.0



■ORDERING METHOD

Please specify the following when ordering.
①Drill Name ②Diameter of Drill (DC) ③Length of Drill (OAL) ④Outside Diameter of Driver (DCON) and Type ⑤Workpiece Material, Drilling Accuracy, Drilling Depth and Drilling Mode (Through Hole, Blind Hole)
e.g.) General Gun Drill ϕ8 x 500 x ϕ19.5 A type Driver, SCM440(250HB) x $\phi 8^{\pm 0.020}$ 300 x Through Hole

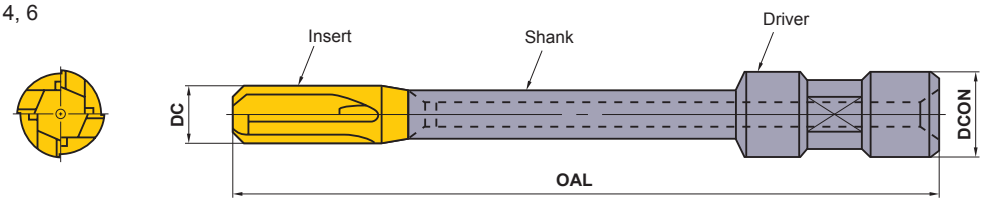
GUN REAMER

BRAZED TYPE

Technical Info >> 1997

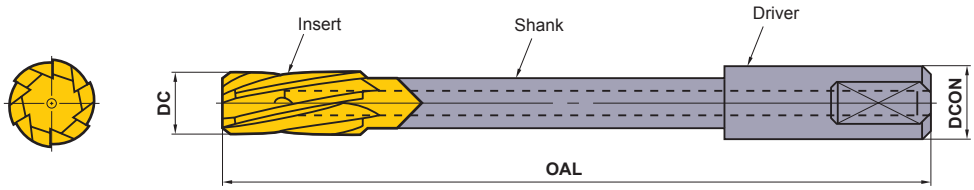
●Straight Reamer Type

●Reamer Diameter : ϕ6.0—ϕ30.0
●Number of teeth : 1, 2, 3, 4, 6



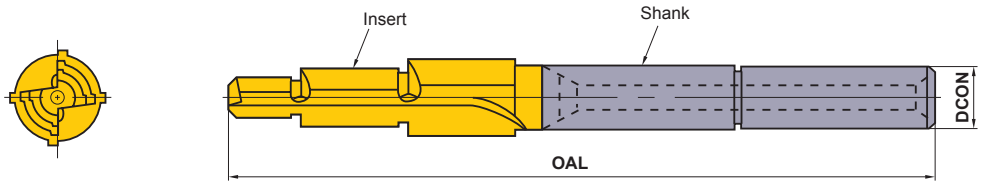
●Spiral Reamer Type

●Reamer Diameter : ϕ6.0—ϕ30.0
●Number of teeth : 4, 6



●Line Reamer Type

●Reamer Diameter : ϕ6.0—ϕ30.0
●Number of teeth : 1, 2, 4



■ORDERING METHOD

Please specify the following when ordering.
①Reamer Name ②Diameter of Reamer (DC) ③Length of Reamer (OAL) ④Outside Diameter of Driver (DCON) and Type
⑤Number of Teeth ⑥Workpiece Material, Drilling Accuracy, Drilling Depth and Drilling Mode (Through Hole, Blind Hole)
e.g.) General Gun Reamer ϕ12 x 450 x ϕ19.5 A type Driver, 4-Teeth, FC250 (180HB) x $\phi 12^{\pm 0.020}$ x 100 x Through Hole

ISO13399 Compliance

List of Property Symbols Complying with ISO13399

Alphabetical

Source: ISO13399 standard
URL : https://www.iso.org/search/x/query/13399

ISO13399 Property Symbols	Content	English Names
ADJLX	Adjustment limit maximum	adjustment limit maximum
ADJRG	Adjustment range	adjustment range
ALF	Clearance angle radial	clearance angle radial
ALP	Clearance angle axial	clearance angle axial
AN	Clearance angle major	clearance angle major
ANN	Clearance angle minor	clearance angle minor
APMX	Depth of cut maximum	depth of cut maximum
AS	Clearance angle wiper edge	clearance angle wiper edge
ASP	Adjusting screw protrusion	adjusting screw protrusion
AZ	Plunge depth maximum	plunge depth maximum
B	Shank width	shank width
BBD	Balanced by design	balanced by design
BCH	Corner chamfer length	corner chamfer length
BD	Body diameter	body diameter
BDX	Body diameter maximum	body diameter maximum
BHCC	Bolt hole circle count	bolt hole circle count
BHTA	Body half taper angle	body half taper angle
BMC	Body material code	body material code
BS	Wiper edge length	wiper edge length
BSR	Wiper edge radius	wiper edge radius
CASC	Cartridge size code	cartridge size code
CB	Chip breaker face count	chip breaker face count
CBDP	Connection bore depth	connection bore depth
CBMD	Chip breaker manufacturers designation	chip breaker manufacturers designation
CBP	Chip breaker property	chip breaker property
CCMS	Connection code machine side	connection code machine side
CCWS	Connection code workpiece side	connection code workpiece side
CCP	Chamfer corner property	chamfer corner property
CDI	Insert cutting diameter	insert cutting diameter
CDX	Cutting depth maximum	cutting depth maximum
CEATC	Tool cutting edge angle type code	tool cutting edge angle type code
CECC	Cutting edge condition code	cutting edge condition code
CEDC	Cutting edge count	cutting edge count
CF	Spot chamfer	spot chamfer
CHW	Corner chamfer width	corner chamfer width
CICT	Cutting item count	cutting item count
CNC	Corner count	corner count
CND	Coolant entry diameter	coolant entry diameter
CNSC	Coolant entry style code	coolant entry style code
CNT	Coolant entry thread size	coolant entry thread size
CP	Coolant pressure	coolant pressure
CRE	Spot radius	spot radius
CRKS	Connection retention knob thread size	connection retention knob thread size
CSP	Coolant supply property	coolant supply property
CTP	Coating property	coating property
CTX	Cutting point translation X-direction	cutting point translation X-direction
CTY	Cutting point translation Y-direction	cutting point translation Y-direction
CUTDIA	Work piece parting diameter maximum	work piece parting diameter maximum
CUB	Connection unit basis	connection unit basis
CW	Cutting width	cutting width
CWX	Cutting width maximum	cutting width maximum
CXD	Coolant exit diameter	coolant exit diameter

ISO13399 Property Symbols	Content	English Names
CXSC	Coolant exit style code	coolant exit style code
CZC	Connection size code	connection size code
D1	Fixing hole diameter	fixing hole diameter
DAH	Diameter access hole	diameter access hole
DAXN	Axial groove outside diameter minimum	axial groove outside diameter minimum
DAXX	Axial groove outside diameter maximum	axial groove outside diameter maximum
DBC	Diameter bolt circle	diameter bolt circle
DC	Cutting diameter	cutting diameter
DCB	Connection bore diameter	connection bore diameter
DCBN	Connection bore diameter minimum	connection bore diameter minimum
DCBX	Connection bore diameter maximum	connection bore diameter maximum
DCC	Design configuration style code	design configuration style code
DCCB	Counterbore diameter connection bore	counterbore diameter connection bore
DCIN	Cutting diameter internal	cutting diameter internal
DCINN	Cutting diameter internal minimum	cutting diameter internal minimum
DCINX	Cutting diameter internal maximum	cutting diameter internal maximum
DCN	Cutting diameter minimum	cutting diameter minimum
DCON	Connection diameter	connection diameter
DCONMS	Connection diameter machine side	connection diameter machine side
DCONWS	Connection diameter workpiece side	connection diameter workpiece side
DCSC	Cutting diameter size code	cutting diameter size code
DCSFMS	Contact surface diameter machine side	contact surface diameter machine side
DCX	Cutting diameter maximum	cutting diameter maximum
DF	Flange diameter	flange diameter
DHUB	Hub diameter	hub diameter
DMIN	Mminimum bore diameter	minimum bore diameter
DMM	Shank diameter	shank diameter
DN	Neck diameter	neck diameter
DRVA	Drive angle	drive angle
EPSR	Insert included angle	insert included angle
FHA	Flute helix angle	flute helix angle
FHCSA	Fixing hole countersunk angle	fixing hole countersunk angle
FHCSD	Fixing hole countersunk diameter	fixing hole countersunk diameter
FLGT	Flange thickness	flange thickness
FMT	Form type	form type
FXHLP	Fixing hole property	fixing hole property
GAMF	Rake angle radial	rake angle radial
GAMN	Rake angle normal	rake angle normal
GAMO	Rake angle orthogonal	rake angle orthogonal
GAMP	Rake angle axial	rake angle axial
GAN	Insert rake angle	insert rake angle
H	Shank height	shank height
HA	Thread height theoretical	thread height theoretical
HAND	Hand	hand
HBH	Head bottom offset height	head bottom offset height
HBKL	Head back offset length	head back offset length
HBKW	Head back offset width	head back offset width
HBL	Head bottom offset length	head bottom offset length
HC	Thread height actual	thread height actual
HF	Functional height	functional height
HHUB	Hub height	hub height
HTB	Body height	body height
IC	Inscribed circle diameter	inscribed circle diameter
IFS	Insert mounting style code	insert mounting style code
IIC	Insert interface code	insert interface code
INSL	Insert length	insert length
KAPR	Tool cutting edge angle	tool cutting edge angle
KCH	Corner chamfer angle	corner chamfer angle

ISO13399 Property Symbols	Content	English Names
KRINS	Cutting edge angle major	cutting edge angle major
KWW	Keyway width	keyway width
KYP	Keyway property	keyway property
L	Cutting edge length	cutting edge length
LAMS	Inclination angle	inclination angle
LB	Body length	body length
LBB	Chip breaker width	chip breaker width
LBX	Body length maximum	body length maximum
LCCB	Counterbore depth connection bore	counterbore depth connection bore
LCF	Length chip flute	length chip flute
LDRED	Reduced body diameter length	reduced body diameter length
LE	Cutting edge effective length	cutting edge effective length
LF	Functional length	functional length
LFA	a dimension on lf	a dimension on lf
LH	Head length	head length
LPR	Protruding length	protruding length
LS	Shank length	shank length
LSC	Clamping length	clamping length
LSCN	Clamping length minimum	clamping length minimum
LSCX	Clamping length maximum	clamping length maximum
LTA	LTA length (length from MCS to CRP)	LTA length (length from MCS to CRP)
LU	Usable length	usable length
LUX	Usable length maximum	usable length maximum
M	m-dimension	m-dimension
M2	m2-dimension	m2-dimension
MHA	Mounting hole angle	mounting hole angle
MHD	Mounting hole distance	mounting hole distance
MHH	Mounting hole height	mounting hole height

TOOL WEAR AND DAMAGE

CAUSES AND COUNTERMEASURES

Tool Damage Form		Cause	Countermeasure
Flank Wear		• Tool grade is too soft. • Cutting speed is too high. • Flank angle is too small. • Feed rate is extremely low.	• Tool grade with high wear resistance. • Lower cutting speed. • Increase flank angle. • Increase feed rate.
Crater Wear		• Tool grade is too soft. • Cutting speed is too high. • Feed rate is too high.	• Tool grade with high wear resistance. • Lower cutting speed. • Lower feed rate.
Chipping		• Tool grade is too hard. • Feed rate is too high. • Lack of cutting edge strength. • Lack of shank or holder rigidity.	• Tool grade with high toughness. • Lower feed rate. • Increase honing. (Round honing is to be changed to chamfer honing.) • Use large shank size.
Fracture		• Tool grade is too hard. • Feed rate is too high. • Lack of cutting edge strength. • Lack of shank or holder rigidity.	• Tool grade with high toughness. • Lower feed rate. • Increase honing. (Round honing is to be changed to chamfer honing.) • Use large shank size.
Plastic Deformation		• Tool grade is too soft. • Cutting speed is too high. • Depth of cut and feed rate are too large. • Cutting temperature is high.	• Tool grade with high wear resistance. • Lower cutting speed. • Decrease depth of cut and feed rate. • Tool grade with high thermal conductivity.
Welding		• Cutting speed is low. • Poor sharpness. • Unsuitable grade.	• Increase cutting speed. (For JIS S45C, cutting speed 80m/min.) • Increase rake angle. • Tool grade with low affinity. (Coated grade, cermet grade)
Thermal Cracks		• Expansion or shrinkage due to cutting heat. • Tool grade is too hard. *Especially in milling.	• Dry cutting. (For wet cutting, flood workpiece with cutting fluid) • Tool grade with high toughness.
Notching		• Hard surfaces such as uncut surfaces, chilled parts and machining hardened layer. • Friction caused by jagged shape chips. (Caused by small vibration)	• Tool grade with high wear resistance. • Increase rake angle to improve sharpness.
Flaking		• Cutting edge welding and adhesion. • Poor chip disposal.	• Increase rake angle to improve sharpness. • Enlarge chip pocket.
Flank Wear Fracture *Damage for polycrystallines		• Damage due to the lack of strength of a curved cutting edge.	• Increase honing. • Tool grade with high toughness.
Crater Wear Fracture *Damage for polycrystallines		• Tool grade is too soft. • Cutting resistance is too high and causes high cutting heat.	• Decrease honing. • Tool grade with high wear resistance.

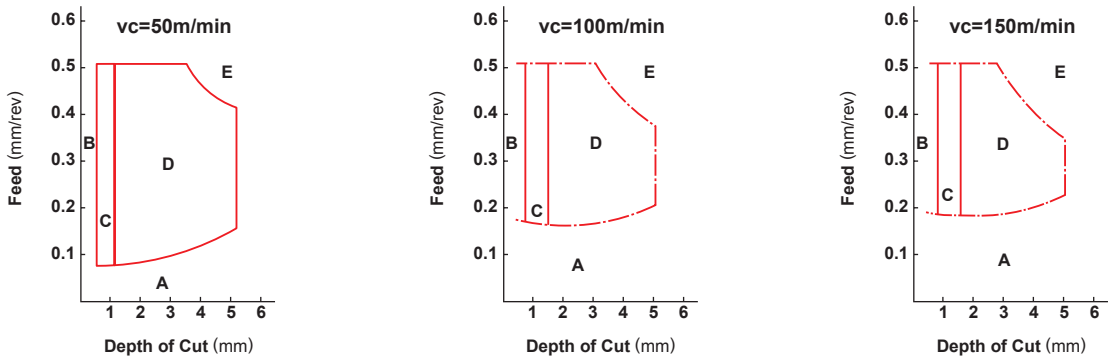
Cutting speed and chip control range of chip breaker

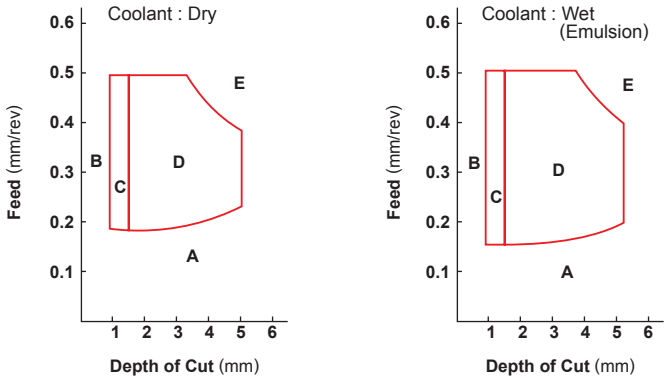
In general, when cutting speed increases, the chip control range tends to become narrower.



Workpiece : **S45C(180HB)**
Insert : **TNMG160408**
Grade : **P10**Cemented Carbide
Tool : **MTJNR2525M16N**
Dry Cutting

Effects of coolant on the chip control range of a chip breaker

If the cutting speed is the same, the range of chip control differs according to whether coolant is used or not.



Workpiece : **S45C**
Cutting Conditions : **vc=100m/min**

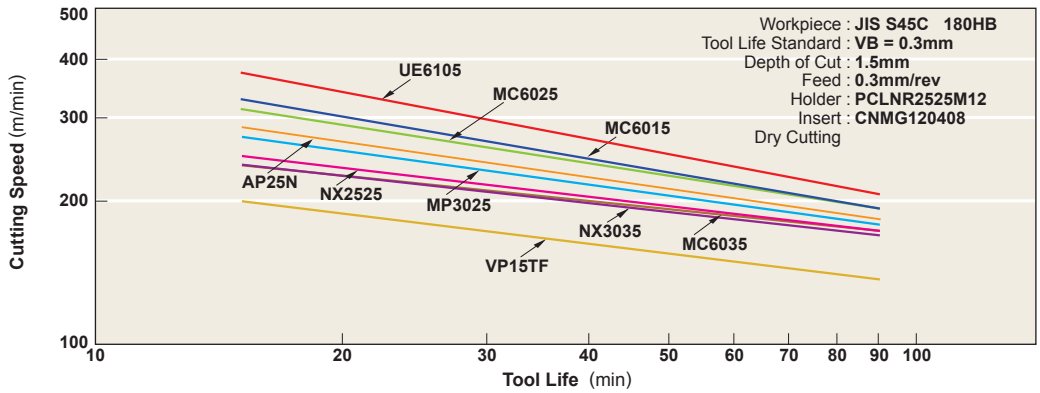
EFFECTS OF CUTTING CONDITIONS FOR TURNING

EFFECTS OF CUTTING CONDITIONS

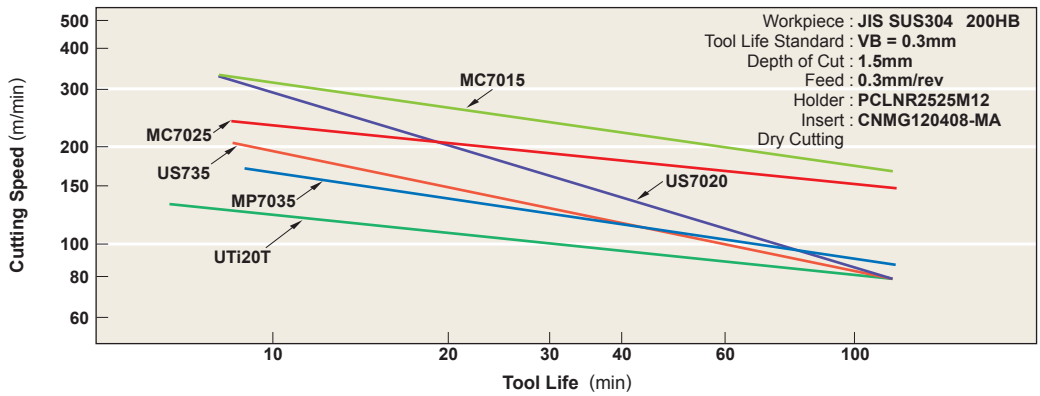
Ideal conditions for cutting are short cutting time, long tool life, and high cutting accuracy. In order to obtain these conditions, selection of efficient cutting conditions and tools, based on work material, hardness, shape and machine capability is necessary.

CUTTING SPEED

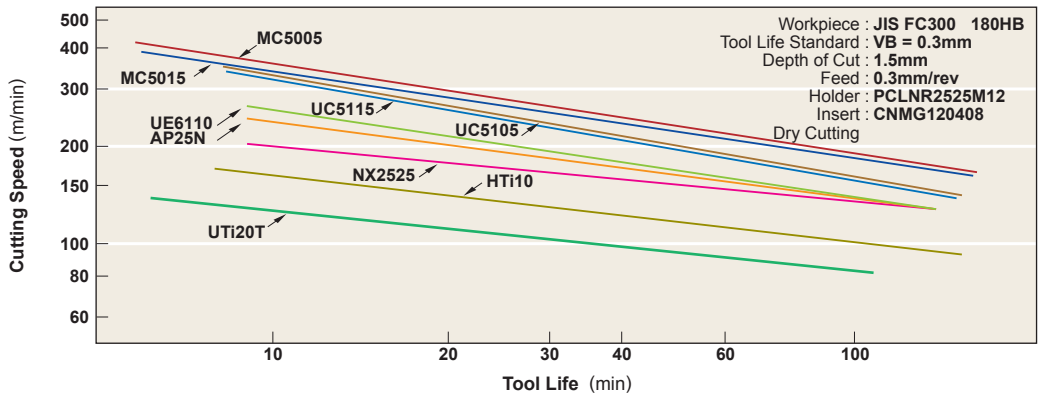
Cutting speed effects tool life greatly. Increasing cutting speed increases cutting temperature and results in shortening tool life. Cutting speed varies depending on the type and hardness of the work material. Selecting a tool grade suitable for the cutting speed is necessary.



P Class Grade Tool Life



M Class Grade Tool Life



K Class Grade Tool Life

Effects of Cutting Speed

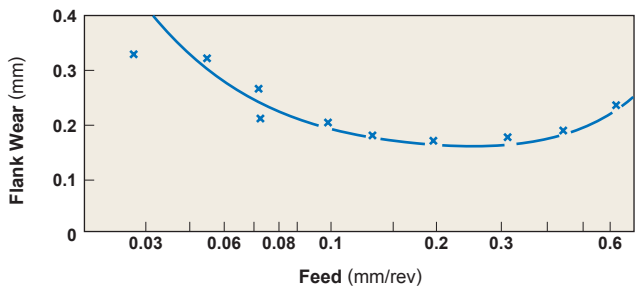
1. Increasing cutting speed by 20% decreases tool life by 50%. Increasing cutting speed by 50% decreases tool life by 80%.
2. Cutting at low cutting speed (20−40m/min) tends to cause chattering. Thus, tool life is shortened.

FEED

When cutting with a general type holder, feed is the distance a holder moves per workpiece revolution. When milling, feed is the distance a machine table moves per cutter revolution divided by the number of inserts. Thus, it is indicated as feed per tooth. Feed rate relates to finished surface roughness.

Effects of Feed

1. Decreasing feed rate results in flank wear and shortens tool life.
2. Increasing feed rate increases cutting temperature and flank wear. However, effects on the tool life is minimal compared to cutting speed.
3. Increasing feed rate improves machining efficiency.



Cutting Conditions Workpiece : **JIS SNCM431** Grade : **STi10T**
Insert : **0-0-5-5-35-35-0.3mm**
Depth of Cut **ap=1.0mm** Cutting Speed **vc=200m/min**
Cutting Time **Tc=10min**

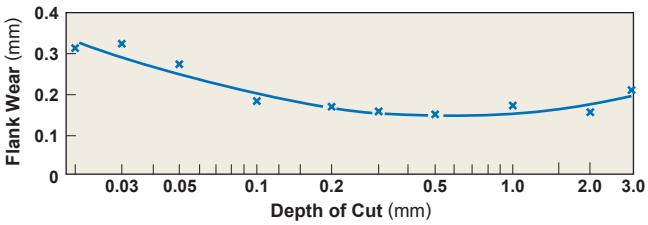
Feed and Flank Wear Relationship in Steel Turning

DEPTH OF CUT

Depth of cut is determined according to the required stock removal, shape of workpiece, power and rigidity of the machine and tool rigidity.

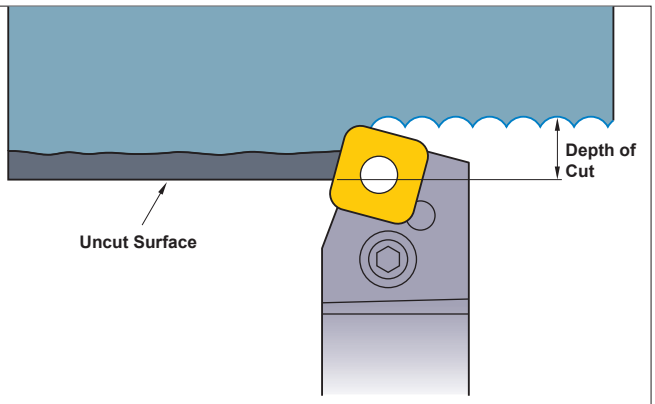
Effects of Depth of Cut

1. Changing depth of cut doesn't effect tool life greatly.
2. Small depths of cut result in friction when cutting the hardened layer of a workpiece. Thus tool life is shortened.
3. When cutting uncut surfaces or cast iron surfaces, the depth of cut needs to be increased as much as the machine power allows in order to avoid cutting impure hard layers with the tip of cutting edge to prevent chipping and abnormal wear.



Cutting Conditions Workpiece : **JIS SNCM431** Grade : **STi10T**
Insert : **0-0-5-5-35-35-0.3mm**
Feed **f=0.20mm/rev** Cutting Speed **vc=200m/min**
Cutting Time **Tc=10min**

Depth of Cut and Flank Wear Relationship in Steel Turning

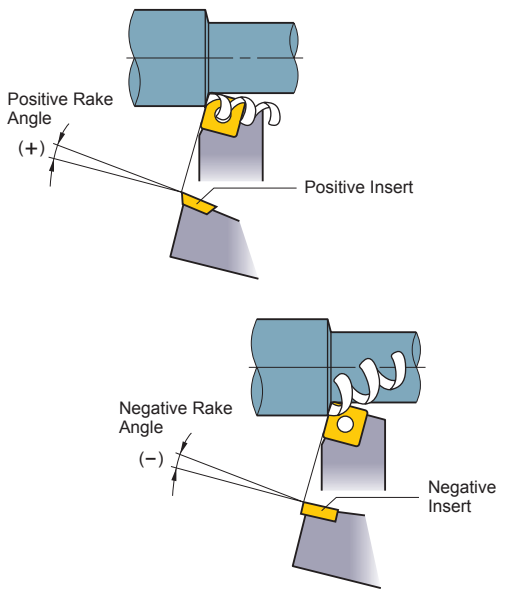


Roughing of Surface Layer that Includes Uncut Surface

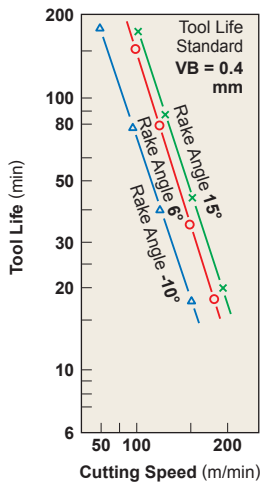
FUNCTION OF TOOL FEATURES FOR TURNING

RAKE ANGLE

Rake angle is cutting edge angle that has a large effect on cutting resistance, chip disposal, cutting temperature and tool life.

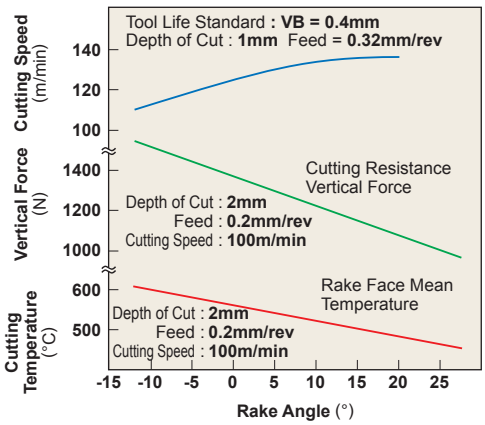


Chip Disposal and Rake Angle



Cutting Conditions
Grade : **STi10**
Depth of Cut : **1mm** Feed : **0.32mm/rev**
Workpiece : **JIS SK5**

Rake Angle and Tool Life



Cutting Conditions
Workpiece : **JIS SK5** Grade : **STi10T**
Insert : **0-Var-5-5-20-20-0.5mm**
Dry Cutting

Effects of Rake Angle on Cutting Speed, Vertical Force, and Cutting Temperature

Effects of Rake Angle

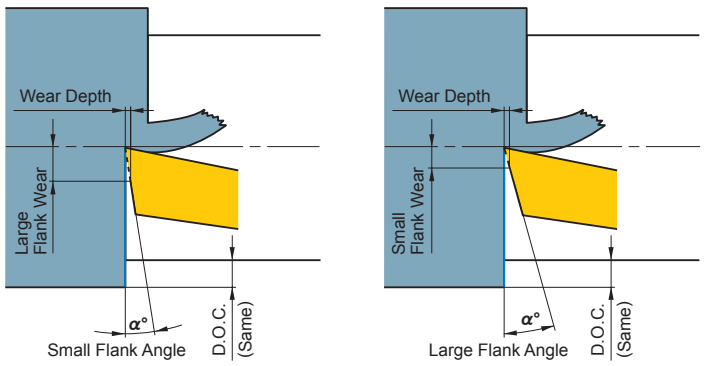
1. Increasing rake angle in the positive (+) direction improves sharpness.
2. Increasing rake angle by 1° in the positive (+) direction decreases cutting power by about 1%.
3. Increasing rake angle in the positive (+) direction lowers cutting edge strength and in the negative (-) direction increases cutting resistance.

When to Increase Rake Angle in the Negative (-) Direction
○ Hard workpieces.
○ When the cutting edge strength is required such as for uncut surfaces and interrupted cutting.

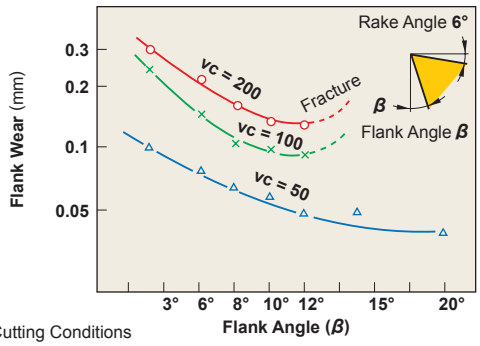
When to Increase Rake Angle in the Positive (+) Direction
○ Soft workpieces.
○ Workpiece is easily machined.
○ When the workpiece or the machine have poor rigidity.

FLANK ANGLE

Flank angle prevents friction between flank face and workpiece resulting in smooth feed.



Flank angle creates a space between tool and workpiece. Flank angle relates to flank wear.



Cutting Conditions
Workpiece : **JIS SNCM431 (200HB)**
Grade : **STi20** Insert : **0-6-β-β-20-20-0.5mm**
Depth of Cut : **1mm** Feed : **0.32mm/rev** Cutting Time : **20min**

Flank Angle and Flank Wear Relationship

Effects of Rake Angle

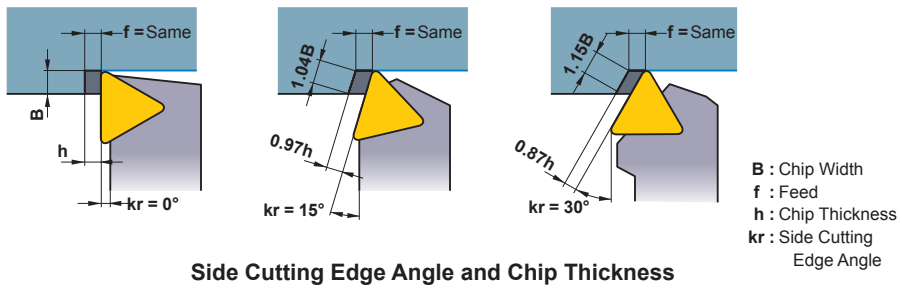
1. Increasing flank angle decreases flank wear occurrence.
2. Increasing flank angle lowers cutting edge strength.

When to Decrease Flank Angle
○ Hard workpieces.
○ When cutting edge strength is required.

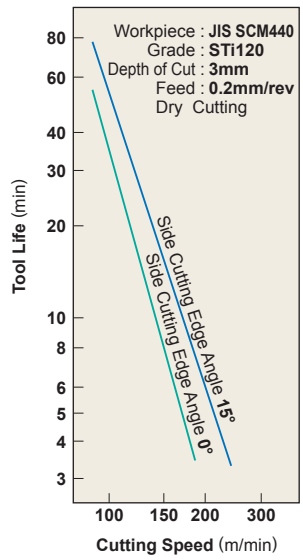
When to Increase Flank Angle
○ Soft workpieces.
○ Workpieces suffer from work hardening easily.

SIDE CUTTING EDGE ANGLE (LEAD ANGLE)

The side cutting edge angle reduces impact load and effects the amount of feed force, back force and chip thickness.



Side Cutting Edge Angle and Chip Thickness

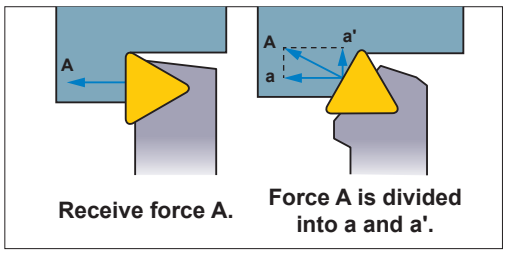


Side Cutting Edge and Tool Life

Effects of Side Cutting Edge Angle (Lead Angle)

1. At the same feed rate, increasing the side cutting edge angle increases the chip contact length and decreases chip thickness. As a result, the cutting force is dispersed on a longer cutting edge and tool life is prolonged. (Refer to the chart.)
2. Increasing the side cutting edge angle increases force a'. Thus, thin, long workpieces suffer from bending in some cases.
3. Increasing the side cutting edge angle decreases chip control.
4. Increasing the side cutting edge angle decreases the chip thickness and increases chip width. Thus, breaking chips is difficult.

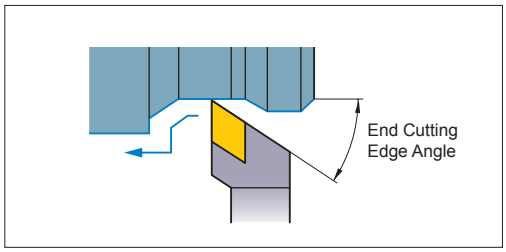
When to Decrease Lead Angle	When to Increase Lead Angle
○ Finishing with small depth of cut. ○ Thin, long workpieces. ○ When the machine has poor rigidity.	○ Hard workpieces which produce high cutting temperature. ○ When roughing a workpiece with large diameter. ○ When the machine has high rigidity.



Receive force A. Force A is divided into a and a'.

END CUTTING EDGE ANGLE

The end cutting edge angle avoids interference between the machined surface and the tool (end cutting edge). Usually 5°–15°.

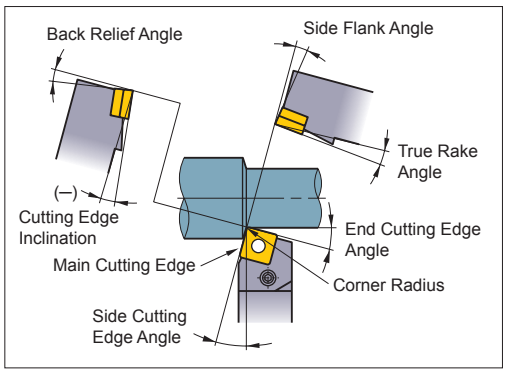


Effects of End Cutting Edge Angle

1. Decreasing the end cutting edge angle increases cutting edge strength, but it also increases cutting edge temperature.
2. Decreasing the end cutting edge angle increases the back force and can result in chattering and vibration while machining.
3. Small end cutting edge angle for roughing and large angle for finishing are recommended.

CUTTING EDGE INCLINATION

Cutting edge inclination indicates inclination of the rake face. During heavy cutting, the cutting edge receives an extremely large shock at the beginning of each cut. Cutting edge inclination keeps the cutting edge from receiving this shock and prevents fracturing. 3°–5° in turning and 10°–15° in milling are recommended.

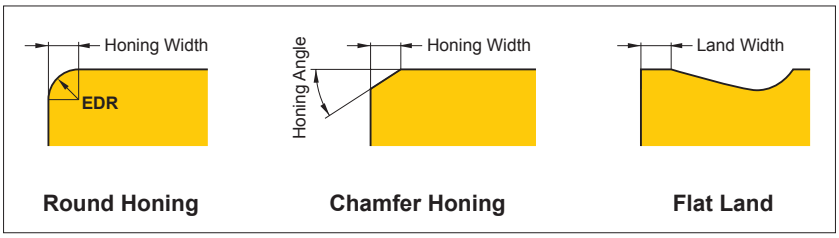


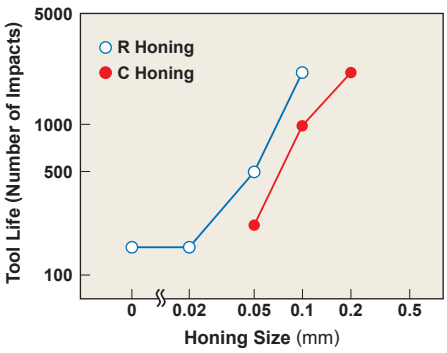
Effects of Cutting Edge Inclination

1. Negative (–) cutting edge inclination disposes chips in the workpiece direction, and positive (+) disposes chips in the opposite direction.
2. Negative (–) cutting edge inclination increases cutting edge strength, but it also increases the back force of cutting resistance. Thus, chattering can easily occur.

HONING AND LAND

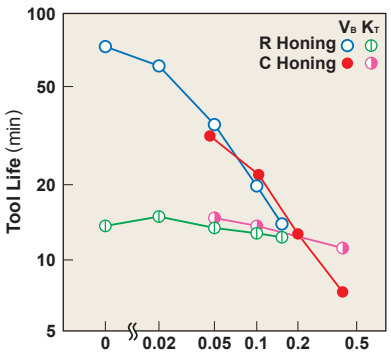
Honing and land are cutting edge shapes that maintain cutting edge strength.
Honing can be round or chamfer type. The optimal honing width is approximately 1/2 of the feed.
Land is the narrow flat area on the rake or flank face.





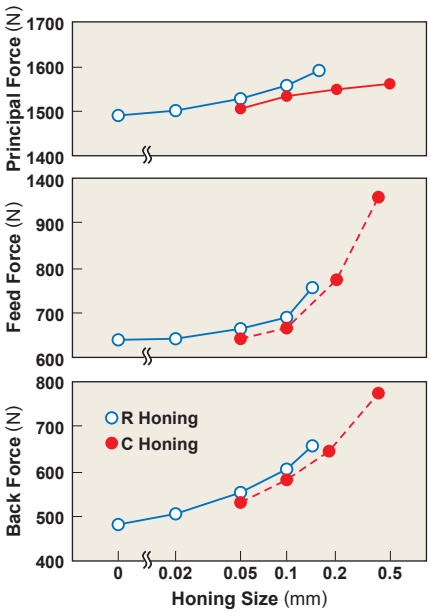
Workpiece : **JIS SNCM439 (280HB)**
Grade : **P10**
Cutting Conditions : **vc=200m/min ap=1.5mm f=0.335mm/rev**

Honing Size and Tool Life Due to Fracturing



Workpiece : **JIS SNCM439 (220HB)**
Grade : **P10**
Cutting Conditions : **vc=160m/min ap=1.5mm f=0.45mm/rev**

Honing Size and Tool Life Due to Wear



Workpiece : **JIS SNCM439 (220HB)**
Grade : **P10**
Cutting Conditions : **vc=100m/min ap=1.5mm f=0.425mm/rev**

Honing Size and Cutting Resistance

Effects of Honing

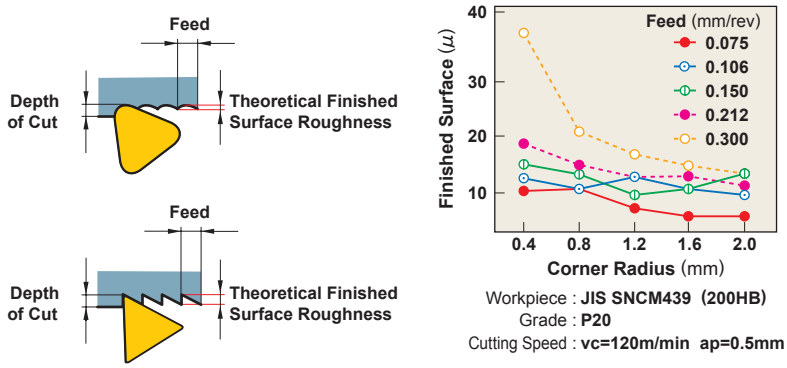
1. Enlarging the honing increases cutting edge strength, tool life and reduces fracturing.
2. Enlarging the honing increases flank wear occurrence and shortens tool life. Honing size doesn't affect rake wear.
3. Enlarging the honing increases cutting resistance and chattering.

When to Decrease Honing Size	When to Increase Honing Size
○ When finishing with small depth of cut and small feed. ○ Soft workpieces. ○ When the workpiece or the machine have poor rigidity.	○ Hard workpieces. ○ When the cutting edge strength is required such as for uncut surfaces and interrupted cutting. ○ When the machine has high rigidity.

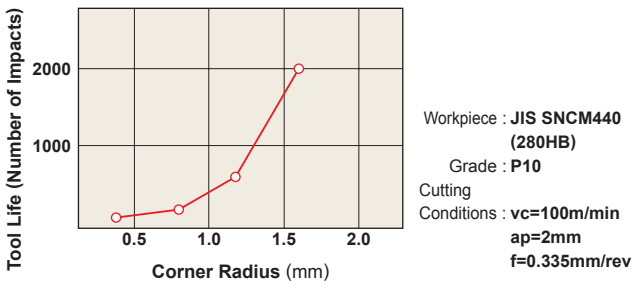
*Cemented carbide, coated diamond, and indexable cermet inserts have round honing as standard.

RADIUS

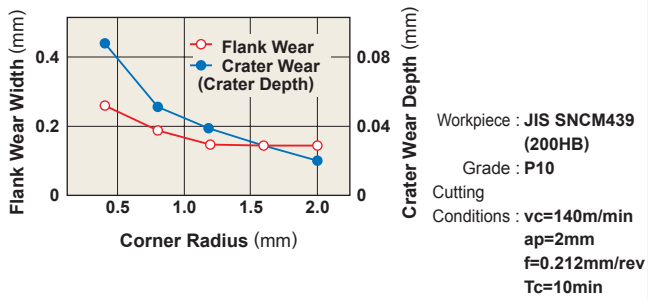
Radius effects the cutting edge strength and finished surface. In general, a corner radius 2−3 times the feed is recommended.



Corner Radius and Finished Surface



Corner Radius Size and Tool Life Due to Fracturing



Corner Radius Size and Tool Wear

Effects of Corner Radius

1. Increasing the corner radius improves the surface finish.
2. Increasing the corner radius improves cutting edge strength.
3. Increasing the corner radius too much increases the cutting resistance and causes chattering.
4. Increasing the corner radius decreases flank and rake wear.
5. Increasing the corner radius too much results in poor chip control.

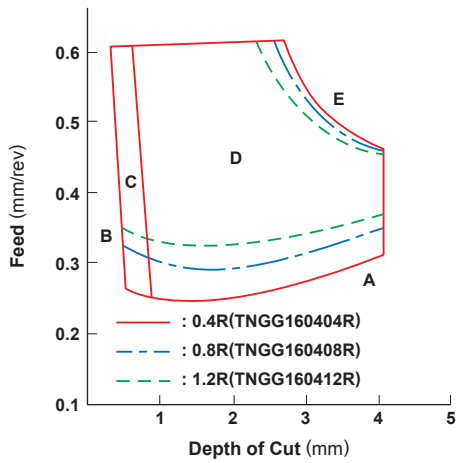
When to Decrease Corner Radius

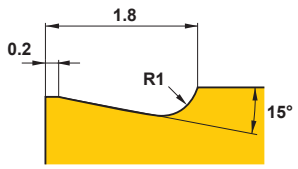
- ○Finishing with small depth of cut.
- ○Thin, long workpieces.
- ○When the machine has poor rigidity.

When to Increase Corner Radius

- ○When the cutting edge strength is required such as in intrrupted cutting and uncut surface cutting.
- ○When roughing a workpiece with large diameter.
- ○When the machine has high rigidity.

Corner Radius and Chip Control Range





Workpiece : JIS S45C (180HB)
Insert : TNGG160404R
TNGG160408R
TNGG160412R

Dry Cutting

FORMULAE FOR CUTTING POWER

CUTTING POWER (Pc)

$$Pc = \frac{ap \cdot f \cdot vc \cdot Kc}{60 \times 10^3 \times \eta} \text{ (kW)}$$

Pc (kW)	: Actual Cutting Power	**ap (mm)**	: Depth of Cut
f (mm/rev)	: Feed per Revolution	**vc (m/min)**	: Cutting Speed
Kc (MPa)	: Specific Cutting Force	**η**	: (Machine Coefficient)

(Problem) What is the cutting power required for machining mild steel at cutting speed 120m/min with depth of cut 3mm and feed 0.2mm/rev (Machine coefficient 80%) ?

(Answer) Substitute the specific cutting force Kc=3100MPa into the formula.

$$Pc = \frac{3 \times 0.2 \times 120 \times 3100}{60 \times 10^3 \times 0.8} = 4.65 \text{(kW)}$$

Kc

Work Material	Tensile Strength(MPa) and Hardness	Specific Cutting Force Kc (MPa)				
		0.1 (mm/rev)	0.2 (mm/rev)	0.3 (mm/rev)	0.4 (mm/rev)	0.6 (mm/rev)
Mild Steel	**520**	3610	3100	2720	2500	2280
Medium Steel	**620**	3080	2700	2570	2450	2300
Hard Steel	**720**	4050	3600	3250	2950	2640
Tool Steel	**670**	3040	2800	2630	2500	2400
Tool Steel	**770**	3150	2850	2620	2450	2340
Chrome Manganese Steel	**770**	3830	3250	2900	2650	2400
Chrome Manganese Steel	**630**	4510	3900	3240	2900	2630
Chrome Molybdenum Steel	**730**	4500	3900	3400	3150	2850
Chrome Molybdenum Steel	**600**	3610	3200	2880	2700	2500
Nickel Chrome Molybdenum Steel	**900**	3070	2650	2350	2200	1980
Nickel Chrome Molybdenum Steel	**352HB**	3310	2900	2580	2400	2200
Hard Cast Iron	**46HRC**	3190	2800	2600	2450	2270
Meehanite Cast Iron	**360**	2300	1930	1730	1600	1450
Grey Cast Iron	**200HB**	2110	1800	1600	1400	1330

CUTTING SPEED (vc)

$$vc = \frac{\pi \cdot Dm \cdot n}{1000} \text{ (m/min)}$$

vc	**(m/min)**	: Cutting Speed
Dm	**(mm)**	: Workpiece Diameter
π	**(3.14)**	: Pi
n	**(min^{-1})**	: Main Axis Spindle Speed

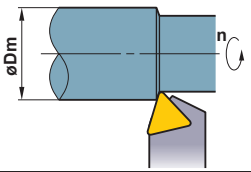
*Divide by 1000 to change to m from mm.

(Problem) What is the cutting speed when main axis spindle speed is 700min^{-1} and external diameter is ϕ50 ?

(Answer) Substitute π=3.14, Dm=50, n=700 into the formula.

$$vc = \frac{\pi \cdot Dm \cdot n}{1000} = \frac{3.14 \times 50 \times 700}{1000} = 110\text{m/min}$$

Cutting speed is 110m/min.



FEED (f)

$$f = \frac{l}{n} \text{ (mm/rev)}$$

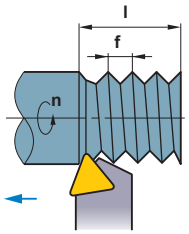
f	**(mm/rev)**	: Feed per Revolution
l	**(mm/min)**	: Cutting Length per Min.
n	**(min^{-1})**	: Main Axis Spindle Speed

(Problem) What is the feed per revolution when main axis spindle speed is 500min^{-1} and cutting length per minute is 120mm/min ?

(Answer) Substitute n=500, l=120 into the formula.

$$f = \frac{l}{n} = \frac{120}{500} = 0.24\text{mm/rev}$$

The answer is 0.24mm/rev.



CUTTING TIME (Tc)

$$Tc = \frac{lm}{l} \text{ (min)}$$

Tc	**(min)**	: Cutting Time
lm	**(mm)**	: Workpiece Length
l	**(mm/min)**	: Cutting Length per Min.

(Problem) What is the cutting time when 100mm workpiece is machined at 1000min^{-1} with feed = 0.2mm/rev ?

(Answer) First, calculate the cutting length per min. from the feed and spindle speed.

$$l = f \times n = 0.2 \times 1000 = 200\text{mm/min}$$

Substitute the answer above into the formula.

$$Tc = \frac{lm}{l} = \frac{100}{200} = 0.5\text{min}$$

0.5 x 60=30 (sec.) The answer is 30 sec.

THEORETICAL FINISHED SURFACE ROUGHNESS (h)

$$h = \frac{f^2}{8RE} \times 1000 (\mu m)$$

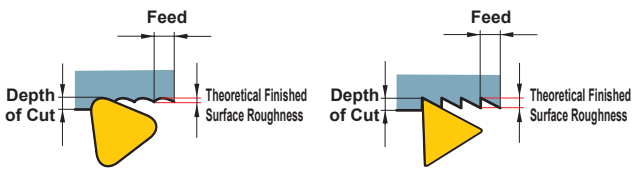
h	**(μm)**	: Finished Surface Roughness
f	**(mm/rev)**	: Feed per Revolution
RE	**(mm)**	: Insert Corner Radius

(Problem) What is the theoretical finished surface roughness when the insert corner radius is 0.8mm and feed is 0.2mm/rev ?

(Answer) Substitute f=0.2mm/rev, RE=0.8 into the formula.

$$h = \frac{0.2^2}{8 \times 0.8} \times 1000 = 6.25 \mu m$$

The theoretical finished surface roughness is 6μm.



TROUBLE SHOOTING FOR THREADING

TROUBLE SHOOTING

Problems	Observation	Causes	Solutions
Low thread precision.	Threads do not mesh with each other.	Incorrect tool installation.	Set the insert center height at 0mm.
			Check holder inclination (Lateral).
	Shallow thread.	Incorrect depth of cut.	Modify the depth of cut.
		Lack of insert wear or plastic deformation resistance.	Refer to "Quickly generated flank wear." and "Large plastic deformation." below.
Poor surface finish.	Surface damage.	Chips wrap around or clog the work pieces.	Change to flank infeed and control the chip discharge direction.
			Change to an M-class insert with a 3-D chip breaker.
		The side of the insert cutting edge interferes with the workpiece.	Check the lead angle and select an appropriate shim.
	Surface tears.	Built-up edge (Welding).	Increase cutting speed.
			Increase coolant pressure and volume.
		Cutting resistance too high.	Decrease depth of cut per pass.
	Surface vibrations.	Cutting speed too high.	Decrease the cutting speed.
		Insufficient work piece or tool clamping.	Re-check work piece and tool clamping. (Chuck pressure, clamping allowance)
		Incorrect tool installation.	Set the insert center height at 0mm.
Short tool life.	Flank wear quickly generated.	Cutting speed too high.	Decrease the cutting speed.
		Too many passes causes abrasive wear.	Reduce the number of passes.
		Small depth of cut for the finishing pass.	Do not re-cut at 0mm depth of cut, larger than 0.05mm depth of cut is recommended.
	Non-uniform wear of the right and left sides of the cutting edge.	The work piece lead angle and the tool lead angle do not match.	Check the work piece lead angle and select an appropriate shim.
	Chipping and fracture.	Cutting speed too low.	Increase cutting speed.
		Cutting resistance too high.	Increase the number of passes and decrease the cutting resistance per pass.
		Unstable clamping.	Check work piece deflection.
			Shorten tool overhang.
			Recheck work piece and tool clamping. (Chuck pressure, clamping allowance)
		Chip packing.	Increase coolant pressure to blow away chips.
			Change the tool pass to control chips. (Lengthen each pass to allow the coolant to clear the chips.
			Change from standard internal cutting to back turning to prevent chip jamming.
		Non-chamfered work pieces causes high resistance at the start of each pass.	Chamfer the workpiece entry and exit faces.
	Large plastic deformation.	High cutting speed and large heat generation.	Decrease the cutting speed.
		Lack of coolant supply.	Check coolant is supply is sufficient.
			Increase coolant pressure and volume.
		Cutting resistance too high.	Increase the number of passes and decrease the cutting resistance per pass.

DRILL DIAMETERS FOR PREPARED HOLES

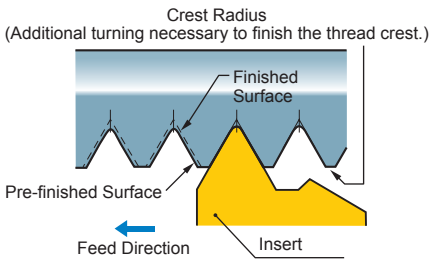
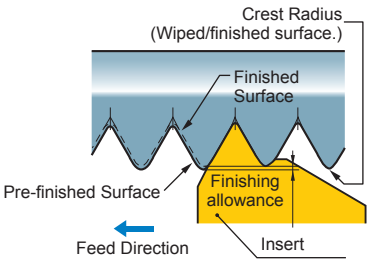
(Note) When using the drill diameters shown in this table, that the processed hole should be measured since the size accuracy of a drill hole may change due to the drilling condition, and that if found to be inappropriate for a prepared hole, the drill diameter must be corrected accordingly.

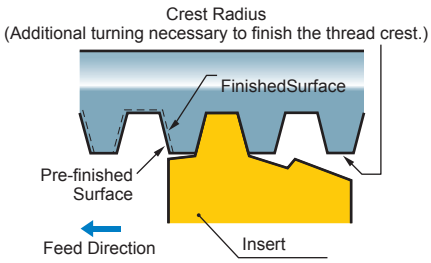
THREADING METHODS

THREADING METHODS

	Right Hand Thread	Left Hand Thread
EXTERNAL	 Holder Reversed	 Holder Reversed
INTERNAL		
INSERT TYPES

Partial form	Full form	Semi-full form (Trapezoidal threads only)
● The same insert can be used for a range of pitches. ● Shorter tool life because the corner radius of the insert is smaller than that of the full form insert. ● Finishing with another operation is necessary.	● No deburring needed after threading. ● Requires different threading inserts.	● No deburring needed after threading. ● Requires different threading inserts. ● Finishing with another operation is necessary.
		






INFEED METHODS

	Radial Infeed	Flank Infeed	Modified Flank Infeed	Incremental Infeed
				Features – Advantages	● Easiest to use. (Standard programme for threading) ● Wide application. (Cutting conditions easy to change.) ● Uniform wear of the right and left sides of the cutting edge.	● Relatively easy to use. (Semi-standard program for threading.) ● Reduced cutting force. ● Suitable for large pitch threads or materials that peel easily. ● Good chip discharge.	● Preventing flank wear on the right side of the cutting edge. ● Reduced cutting force. ● Suitable for large pitch threads or materials that peel easily. ● Good chip discharge.	● Uniform flank wear of the right and left sides of the cutting edge. ● Reduced cutting force. ● Suitable for large pitch threads or materials that peel easily.
Features – Disadvantages	● Difficult chip control. ● Subject to vibration in the later in stages of cutting. ● Ineffective for large pitch threading. ● Heavy load on the corner radius.	● Large flank wear on the right side of the cutting edge. ● Relatively difficult to change cutting depth. (Re-programming necessary)	● Complex machining programming. ● Difficult to change cutting depth. (Re-programming necessary)	● Complex machining programming. ● Difficult to change cutting depth. (Re-programming necessary) ● Difficult chip control.

THREADING DEPTH

	Features	
	Advantages	Disadvantages
 Fixed cut area	● Easy to use. (Standard programme for threading.) ● Superior resistance to vibration. (Constant cutting force.)	● Long chips generated during the final pass. ● Complex calculation of cutting depth when changing the number of passes.
 Fixed cutting depth	● Reduced load on corner radius during the first half of the passes. ● Easy chip control. (Optional setting of chip thickness) ● Easy to calculate cutting depth when changing the number of passes. ● Good chip control.	● Subject to vibration in the later stages of cutting. (Increased cutting force) ● In some cases, changing the NC programme is necessary.

* It is recommended to set the depth of cut of the final pass to 0.05mm—0.025mm.
Large cutting depths can cause vibration, leading to a poor surface finish.

FORMULAE

Formulae to calculate infeed for each pass in a reduced series.

$$\triangle ap_n = \frac{ap}{\sqrt{n_{ap}-1}} \times \sqrt{b}$$

$\triangle ap_n$: Depth of cut
n : Actual pass
ap : Total depth of cut
n_{ap} : Number of passes
b : 1st pass 0.3
2nd pass 2—1 = 1
3rd pass 3—1 = 2
•
•
nth pass n—1

(Example)
External threading (ISO Metric)
Pitch : 1.0mm
ap : 0.6mm
n_{ap} : 5 passes

1st Pass $\triangle ap_1 = \frac{0.60}{\sqrt{5-1}} \times \sqrt{0.3} = 0.16 \rightarrow$ **0.16** ($\triangle ap_1$)

2st Pass $\triangle ap_2 = \frac{0.60}{\sqrt{5-1}} \times \sqrt{2-1} = 0.3 \rightarrow$ **0.14** ($\triangle ap_2 - \triangle ap_1$)

3st Pass $\triangle ap_3 = \frac{0.60}{\sqrt{5-1}} \times \sqrt{3-1} = 0.42 \rightarrow$ **0.12** ($\triangle ap_3 - \triangle ap_2$)

4st Pass $\triangle ap_4 = \frac{0.60}{\sqrt{5-1}} \times \sqrt{4-1} = 0.52 \rightarrow$ **0.1** ($\triangle ap_4 - \triangle ap_3$)

5st Pass $\triangle ap_5 = \frac{0.60}{\sqrt{5-1}} \times \sqrt{5-1} = 0.6 \rightarrow$ **0.08** ($\triangle ap_5 - \triangle ap_4$)

NC PROGRAMME FOR MODIFIED FLANK INFEED

Example) M12×1.0 5 passes modified 5°

SELECTING CUTTING CONDITIONS

		Priority					
		Tool Life	Cutting Force	Surface Finish	Precision of thread	Chip Discharge	Efficiency (Reduced Passes)
Threading Methods	Radial	○		○	○		○
	Flank	(△ : Modified)	○	(△ : Modified)		○	
Cutting Depth	Fixed Cutting Depth					○	
	Fixed Cut Area	○	○	○	○		○

* Tool life and surface finish accuracy can be increased by changing the threading method from flank infeed to modified flank infeed.
* Chip control can be improved by increasing the cutting depth in the later half of passes.

CUTTING DEPTH AND THE NUMBER OF PASSES

Selection of the appropriate cutting depth and the right number of passes is vital for threading.

- For most threading, use a "threading cycle program," which has originally been installed on machines, and specify "total cutting depth" and "cutting depth in the first or final pass."
- Cutting depth and the number of passes are easy to change for the radial infeed method, thus making it easy to determine the appropriate cutting conditions.

FEATURES AND BENEFITS OF MITSUBISHI PRODUCTS

- Insert grades with high wear and plastic deformation resistance, specially produced for threading tools, ensure highly efficient cutting by enabling high-speed machining and a reduced number of passes.

ADVICE ON IMPROVED THREADING

Increasing tool life

- To prevent damage to the corner radius - *Recommended method - Modified flank infeed*
- To have uniform flank wear on both sides of a cutting edge - *Recommended method - Radial infeed*
- To prevent crater wear - *Recommended method - Flank infeed*

Preventing chip problems

- Change to flank or modified infeed.
- During radial infeed cutting, use an inverted holder and change the coolant supply to a downward direction.
- When using the radial infeed method, set the minimum cutting depth at around 0.2mm to make the chips thicker.

To achieve highly efficient machining

- Increase cutting speed. (Dependant on the maximum revolution and rigidity of the machine.)
- Reduce the number of passes. (Reduce by 30-40%.)
- A reduced number of passes can improve chip discharge because of the thicker chips generated.

Preventing vibration

- Change to flank or modified infeed.
- When using radial infeed, reduce cutting depth in the later half of passes and lower the cutting speed.

Increased surface finish accuracy

- A final wiping pass should be performed at the same depth of cut as the last regular pass.
- When using the flank infeed method, change to radial infeed only during the final pass.

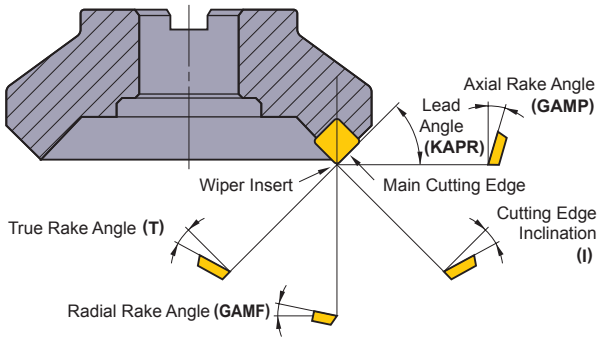
FUNCTION OF TOOL FEATURES FOR FACE MILLING

FUNCTION OF EACH CUTTING EDGE ANGLE IN FACE MILLING

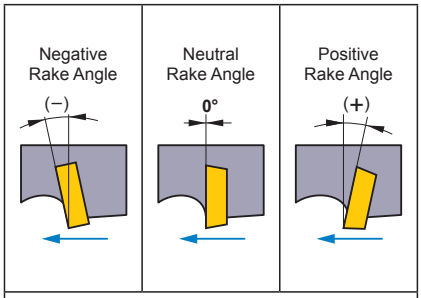


Each Cutting Edge Angle in Face Milling

Type of Angle	Symbol	Function	Effect
Axial Rake Angle	GAMP	Determines chip disposal direction.	**Positive** : Excellent machinability.
Radial Rake Angle	GAMF	Determines sharpness.	**Negative** : Excellent chip disposal.
Lead Angle	KAPR	Determines chip thickness.	**Small** : Thin chips and small cutting impact. Large back force.
True Rake Angle	T	Determines actual sharpness.	**Positive (large)** : Excellent machinability. Minimal welding. **Negative (large)** : Poor machinability. Strong cutting edge.
Cutting Edge Inclination	I	Determines chip disposal direction.	**Positive (large)** : Excellent chip disposal. Low cutting edge strength.

STANDARD INSERTS

Positive and Negative Rake Angle



· Insert shape whose cutting edge precedes is a positive rake angle.
· Insert shape whose cutting edge follows is a negative rake angle.

Standard Cutting Edge Shape

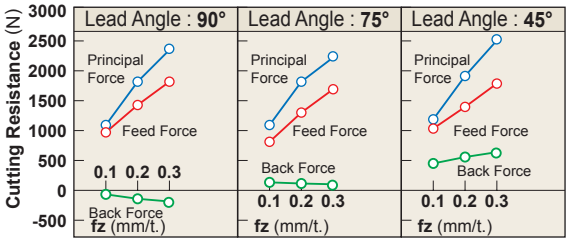
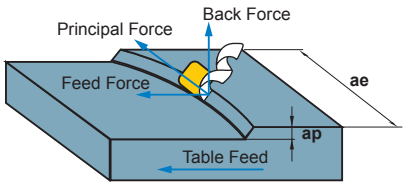
LEAD ANGLE (KAPR) AND CUTTING CHARACTERISTICS



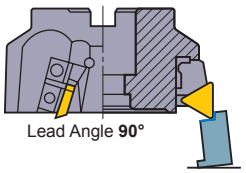
Workpiece : **JIS SCM440 (281HB)**
Tool : **ø125mm** Single Insert
Cutting Conditions : **vc=125.6m/min ap=4mm ae=110mm**

Cutting Resistance Comparison between Different Insert Shapes

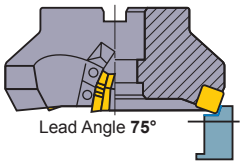


Three Cutting Resistance Forces in Milling

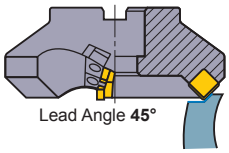
Lead Angle 0°
Back force is in the minus direction. Lifts the workpiece when workpiece clamp rigidity is low.



Lead Angle 15°
Lead angle 75° is recommended for face milling of workpieces with low rigidity such as thin workpieces.



Lead Angle 45°
The largest back force.
Bends thin workpieces and lowers cutting accuracy.
*Prevents workpiece edge chipping when cast iron cutting.

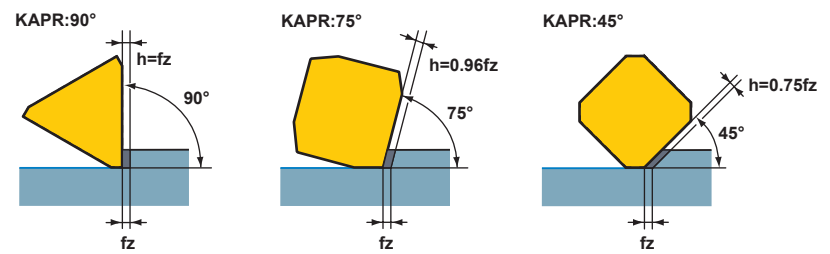


* Principal force : Force is in the opposite direction of face milling rotation.
* Back force : Force that pushes in the axial direction.
* Feed force : Force is in the feed direction and is caused by table feed.

APPROACH ANGLE AND THE TOOL LIFE

Approach Angle and Chip Thickness

When the depth of cut and feed per tooth, fz, are fixed, the smaller the corner angle (KAPR) is, then the thinner the chip thickness (h) becomes (for a 45° KAPR, it is approx. 75% that of a 90° KAPR). This can be seen in below. Therefore as the KAPR increases, the cutting resistance decreases resulting in longer tool life. Note however, if the chip thickness is too large then the cutting resistance can increase leading to vibrations and shortened tool life.



Effects on chip thickness due to the variation of lead angles

Approach Angle and Face Wear

Below shows wear patterns for different lead angles. When comparing crater wear for 90° and 45° lead angles, it can be clearly seen that the ctater wear for 90° lead angle is larger.

	Lead Angle **90°**	Lead Angle **75°**	Lead Angle **45°**
vc=100m/min Tc=69min			
vc=125m/min Tc=55min			vc=160m/min Tc=31min			
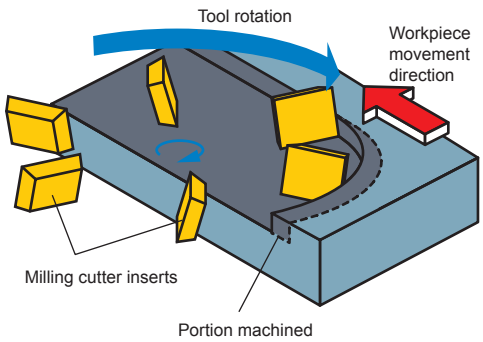
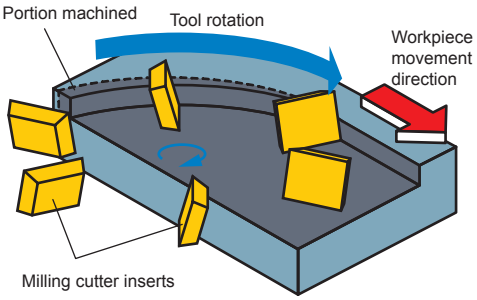
Workpiece : **SNCM439 287HB**
Tools : **DC=125mm**
Insert : **M20**Cemented Carbide
Cutting Conditions : **ap=3.0mm**
ae=110mm
fz=0.2mm/t.
Dry Cutting

UP AND DOWN CUT (CLIMB) MILLING

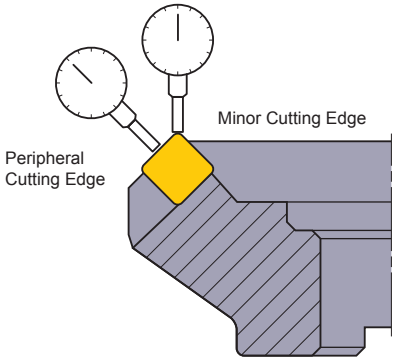
When choosing a method to machine, up cutting or down cut milling (climb milling) is decided by the conditions of the machine tool, the milling cutter and the application. However, it is said that in terms of tool life, down cut (climb) milling is more advantageous.

Up Cut	Down Cut
	




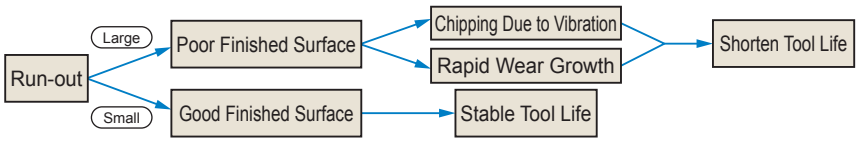
FINISHED SURFACE

Cutting Edge Run-out Accuracy

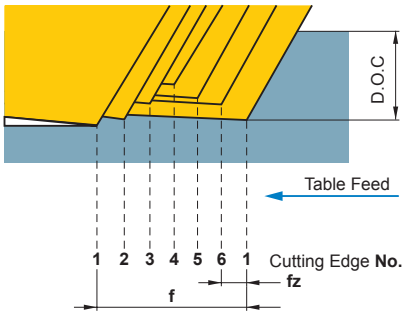


Cutting Edge Run-out and Accuracy in Face Milling

Cutting edge run-out accuracy of indexable inserts on the cutter body greatly affects the surface finish and tool life.



Improve Finished Surface Roughness



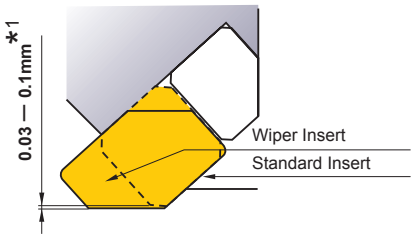
fz : Feed per Tooth
f : Feed per Revolution

Sub Cutting Edge Run-out and Finished Surface

Since Mitsubishi Materials' normal sub cutting edge width is 1.4mm, and the sub cutting edges are set parallel to the face of a milling cutter, theoretically the finished surface accuracy should be maintained even if run-out accuracy is low.

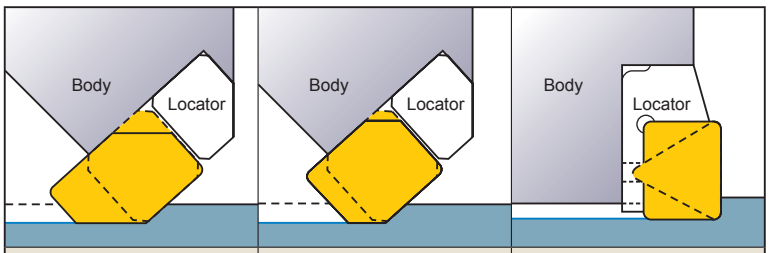
Actual Problems	Countermeasure
· Cutting edge run-out. · Sub cutting edge inclination. · Milling cutter body accuracy. · Spare parts accuracy. · Welding, vibration, chattering.	Wiper Insert

* Machine a surface that has already been per-machined in order to produce smooth finished surface.



· Replace one or two normal inserts with wiper inserts.
· Wiper inserts be set to protrude by 0.03—0.1mm from the standard inserts.
*1.Value depends on the cutting edge and insert combination.

How to Set a Wiper Insert



(a) **One Corner Type**	(b) **Two Corner Type**	(c) **Two Corner Type**
Replace normal insert.	Replace normal insert.	Use locator for wiper insert.

· Sub cutting edge length has to be longer than the feed per revolution.
* Too long sub cutting edge causes chattering.
· When the cutter diameter is large and feed per revolution is longer than the sub cutting edge of the wiper insert, use two or three wiper inserts.
· When using more than 1 wiper inserts, eliminate run-out of wiper inserts.
· Use a high hardness grade (high wear resistance) for wiper inserts.

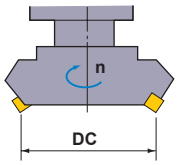
FORMULAE FOR FACE MILLING

CUTTING SPEED (vc)

$$vc = \frac{\pi \cdot DC \cdot n}{1000} \text{ (m/min)}$$

vc (m/min) : Cutting Speed
π (3.14) : Pi
DC (mm) : Cutter Diameter
n (min^{-1}) : Main Axis Spindle Speed

*Divide by 1000 to change to m from mm.



(Problem) What is the cutting speed when main axis spindle speed is 350min^{-1} and the cutter diameter is ϕ125 ?

(Answer) Substitute π=3.14, DC=125, n=350 into the formula.

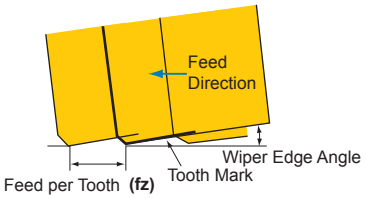
$$vc = \frac{\pi \cdot DC \cdot n}{1000} = \frac{3.14 \times 125 \times 350}{1000} = 137.4 \text{m/min}$$

The cutting speed is 137.4m/min.

FEED PER TOOTH (fz)

$$fz = \frac{vf}{z \cdot n} \text{ (mm/tooth)}$$

fz (mm/tooth) : Feed per Tooth
vf (mm/min) : Table Feed per Min.
n (min^{-1}) : Main Axis Spindle Speed (Feed per Revolution **f = z x fz**)
z : Insert Number



(Problem) What is the feed per tooth when the main axis spindle speed is 500min^{-1}, number of insert is 10, and table feed is 500mm/min ?

(Answer) Substitute the above figures into the formula.

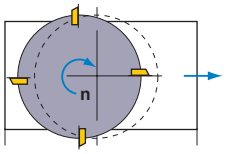
$$fz = \frac{vf}{z \times n} = \frac{500}{10 \times 500} = 0.1 \text{mm/tooth}$$

The answer is 0.1mm/tooth.

TABLE FEED (vf)

$$vf = fz \cdot z \cdot n \text{ (mm/min)}$$

vf (mm/min) : Table Feed per Min.
fz (mm/tooth) : Feed per Tooth
n (min^{-1}) : Main Axis Spindle Speed
z : Insert Number



(Problem) What is the table feed when feed per tooth is 0.1mm/tooth, number of insert is 10, and main axis spindle speed is 500min^{-1}?

(Answer) Substitute the above figures into the formula.

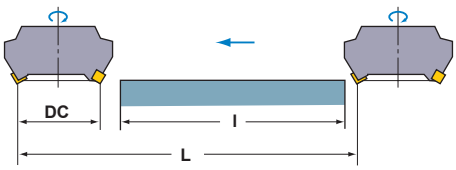
$$vf = fz \times z \times n = 0.1 \times 10 \times 500 = 500 \text{mm/min}$$

The table feed is 500mm/min.

CUTTING TIME (Tc)

$$Tc = \frac{L}{vf} \text{ (min)}$$

Tc (min) : Cutting Time
vf (mm/min) : Table Feed per Min.
L (mm) : Total Table Feed Length (Workpiece Length: (**l**)+Cutter Diameter : (**DC**))



(Problem) What is the cutting time required for finishing 100mm width and 300mm length surface of a cast iron (JIS FC200) block when the cutter diameter is ϕ200mm, the number of inserts is 16, the cutting speed is 125m/min, and feed per tooth is 0.25mm. (spindle speed is 200min^{-1})

(Answer) Calculate table feed per min vf=0.25×16×200=800mm/min
Calculate total table feed length. L=300+200=500mm
Substitute the above answers into the formula.

$$Tc = \frac{500}{800} = 0.625 \text{ (min)}$$

0.625×60=37.5 (sec). The answer is 37.5 sec.

CUTTING POWER (Pc)

$$Pc = \frac{ap \cdot ae \cdot vf \cdot Kc}{60 \times 10^6 \times \eta}$$

Pc (kW)	: Actual Cutting Power	**ap (mm)**	: Depth of Cut
ae (mm)	: Cutting Width	**vf (mm/min)**	: Table Feed per Min.
Kc (MPa)	: Specific Cutting Force	**η**	: (Machine Coefficient)

(Problem) What is the cutting power required for milling tool steel at a cutting speed of 80m/min. With depth of cut 2mm, cutting width 80mm, and table feed 280mm/min by ϕ250 cutter with 12 inserts. Machine coefficient 80%.

(Answer) First, calculate the spindle speed in order to obtain feed per tooth.

$$n = \frac{1000vc}{\pi DC} = \frac{1000 \times 80}{3.14 \times 250} = 101.91 min^{-1}$$

Feed per Tooth $fz = \frac{vf}{z \times n} = \frac{280}{12 \times 101.9} = 0.228 mm/tooth$

Substitute the specific cutting force into the formula.

$$Pc = \frac{2 \times 80 \times 280 \times 1800}{60 \times 10^6 \times 0.8} = 1.68 \text{ kW}$$

Kc

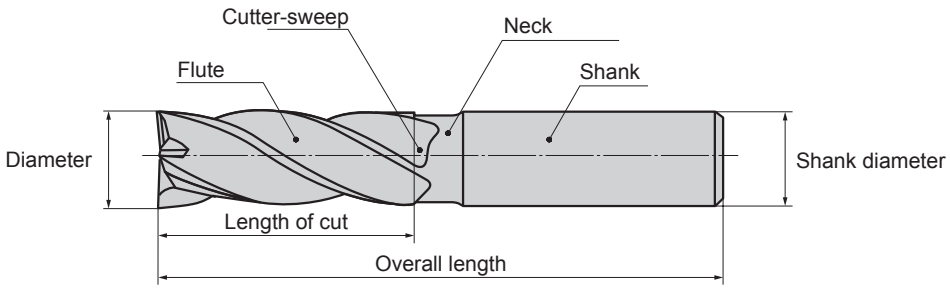
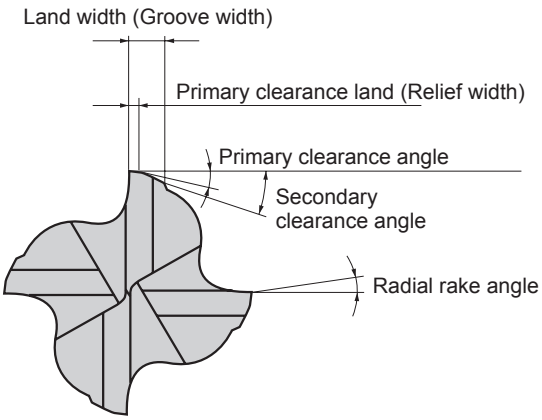
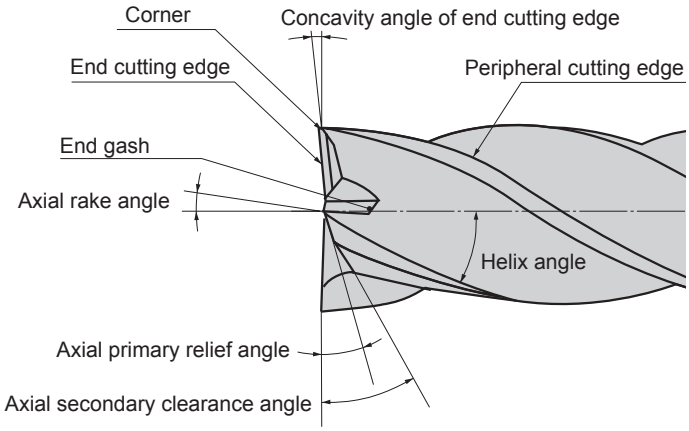
END MILL TERMINOLOGY

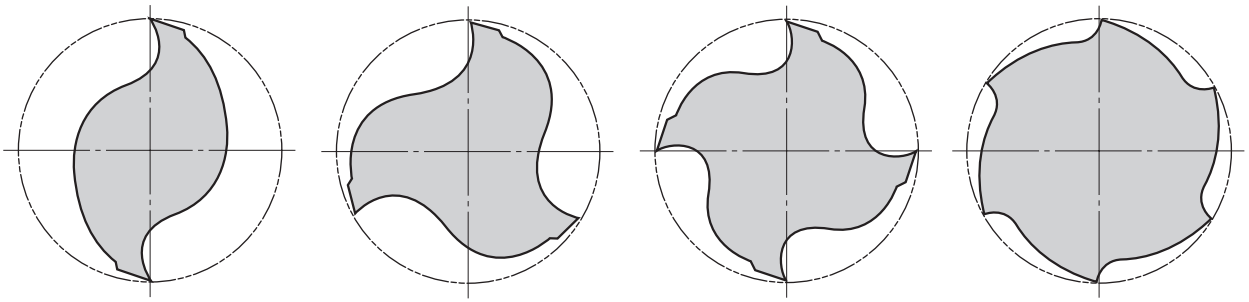
END MILL TERMINOLOGY







COMPARISON OF SECTIONAL SHAPE AREA OF CHIP POCKET



2-flutes 50% | 3-flutes 45% | 4-flutes 40% | 6-flutes 20%

CHARACTERISTICS AND APPLICATIONS OF DIFFERENT-NUMBER-OF-FLUTE END MILLS

		2-flutes	3-flutes	4-flutes	6-flutes
Feature	Advantage	Chip disposability is excellent. Suitable for sinking. Low cutting resistance.	Chip disposability is excellent. Suitable for sinking.	High rigidity	High rigidity. Superior cutting edge durability.
	Fault	Low rigidity	Diameter is not easily measured.	Chip disposability is poor.	Chip disposability is poor.
Usage		Slotting, side milling, sinking etc. Wide range of use.	Slotting, side milling Heavy cutting, finishing	Shallow slotting, side milling Finishing	High Hardness Material Shallow slotting, side milling

TYPES AND SHAPES OF END MILL

Peripheral Cutting Edge

Kind	Shape	Feature
Ordinary Flute		Ordinary flute type is most generally used for the slotting, side milling, and the shoulder milling, etc. Can be used for roughing, semi-finishing, and the finishing.
Tapered Flute		A tapered fute is used for milling mould drafts and angled faces.
Roughing Flute		Because a roughing tooth has a wave-like form and produces small chips. Cutting resistance is low, and is suitable for roughing. Not suitable for finishing. The tooth face is re-grindable.
Formed Flute		A corner radius cutter is shown. An infinite range of form cutters can be produced.

End Cutting Edge

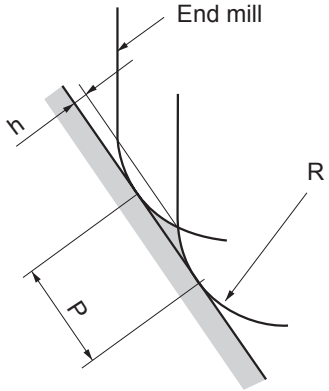
Kind	Shape	Feature
Square End (Centre With Hole)		This is generally used for slotting, side milling, and shoulder milling. Sinking is not possible. Grinding is center supported, making re-grinding accurate.
Square End (Centre Cut)		It is generally used for slotting, side milling, and shoulder milling. Vertical cutting can be performed. Re-grinding is possible.
Ball End		Suitable for profile machining and pick feed milling.
End Radius		For corner radius milling and contouring. Efficient small corner radius milling due to large diameter and small corner radius.

Shank And Neck Parts

Kind	Shape	Feature
Standard (Straight Shank)		For general use.
Long Shank		For deep slotting and has a long shank, so that adjustment of the overhang is possible.
Long Neck		For deep slotting and small diameter end mills, also suitable for boring.
Taper Neck		For best performance in deep slotting and on mould drafts.

PITCH SELECTION OF PICK FEED

PICK FEED MILLING (CONTOURING) WITH BALL NOSE END MILLS AND END MILLS WITH CORNER RADIUS



$$h = R \cdot \left[1 - \cos \left\{ \sin^{-1}\left(\frac{P}{2R} \right) \right\} \right]$$

R : Radius of Ball Nose(RE), Corner Radius(RE)

P : Pick Feed

h : Cusp Height

CORNER R OF END MILLS AND CUSP HEIGHT BY PICK FEED

Unit : mm

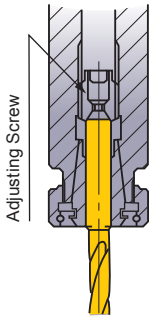
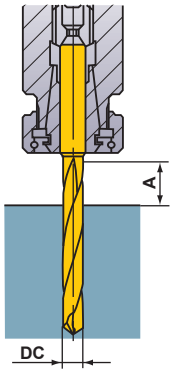
OPERATIONAL GUIDANCE

Drill Holding



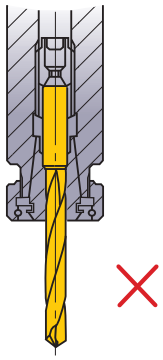
Thrust bearing type collet chuck holds the drill securely.

Drill Length



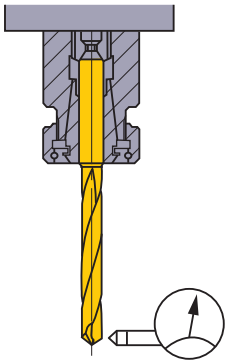
A ≥ DC x 1.5

Drill Installation



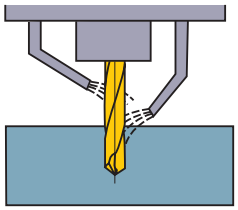
Do not clamp on the flutes.

Installation Tolerance



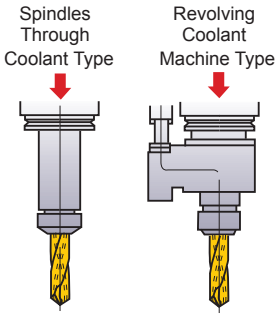
Run-out ≤ 0.03mm

Coolant Method (External Coolant)



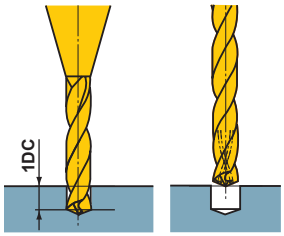
Two coolant positions, at the end and at the center are ideal.

Through Coolant Type (Internal Coolant)



Coolant pressure is approx. 0.5—1MPa (<ϕ5:2—3MPa). Coolant volume is 1.5—4.0l/min.

Drill Installation



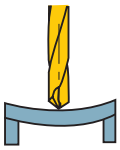
①Pre-prepared hole drilling for 1 DC (DC = diameter)
②Use the prepared hole as a guide when using a drill with an oil hole. Depending on the cutting conditions, peck feed is recommended.

Coolant Handling

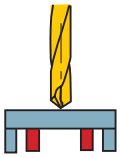
1) Small particles of swarf will jam in the oil hole of small diameter drills. Always use a fine mesh filter as a preventative measure.

2) Dirt and dust particles adhere to the oil in old coolant and prevent an efficient flow. Regular coolant exchange is recommended.

Thin Workpiece

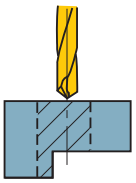


If Bending Occurs ×



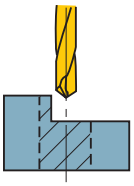
Support the Workpiece ○

Interrupted Cutting



One Process ○

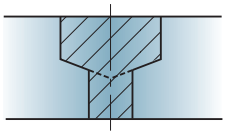
①Lower the feed when drilling the interrupted part.



Requires Prior Machining △

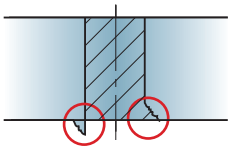
①Spot face with an end mill prior to drilling.

Stepped Holes



①Divide the two processes.
②Drill the larger hole first.
*A tool for machining both chamfer and spot face can be produced to order.

Burring and Workpiece Chipping



①Lower the feed rate by 50% at the end of through cutting.
②Add a 45°chamfer.
③Change the point angle.

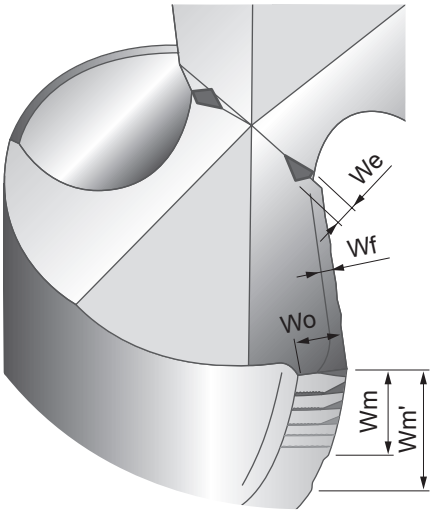
NOTES ON USE

- Please use a fine mesh filter (mesh≤3μm) for coolant to prevent jamming in the oil hole.
- For deep drilling (l/d>3), machining guiding hole is recommended.
- Pick drilling is also effective.

DRILL WEAR AND CUTTING EDGE DAMAGE

DRILL WEAR CONDITION

The table below shows a simple drawing depicting the wear of a drill's cutting edge. The generation and the amount of wear differ according to the workpiece materials and cutting conditions used. But generally, the peripheral wear is largest and determines a drill tool life. When regrinding, the flank wear at the point needs to be ground away completely. Therefore, if there is large wear more material needs to be ground away to renew the cutting edge.



We : **Chisel edge wear width**

Wf : **Flank Wear (The middle of the cutting edge)**

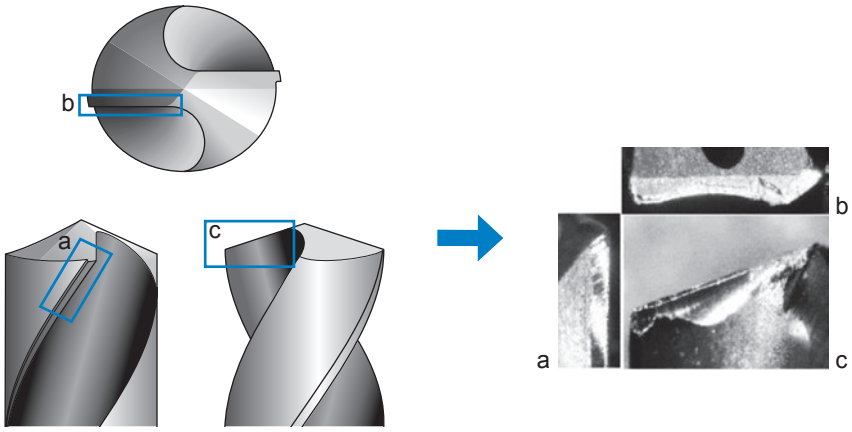
Wo : **Outer corner wear width**

Wm : **Margin wear width**

Wm' : **Margin wear width (Leading edge)**

CUTTING EDGE DAMAGE

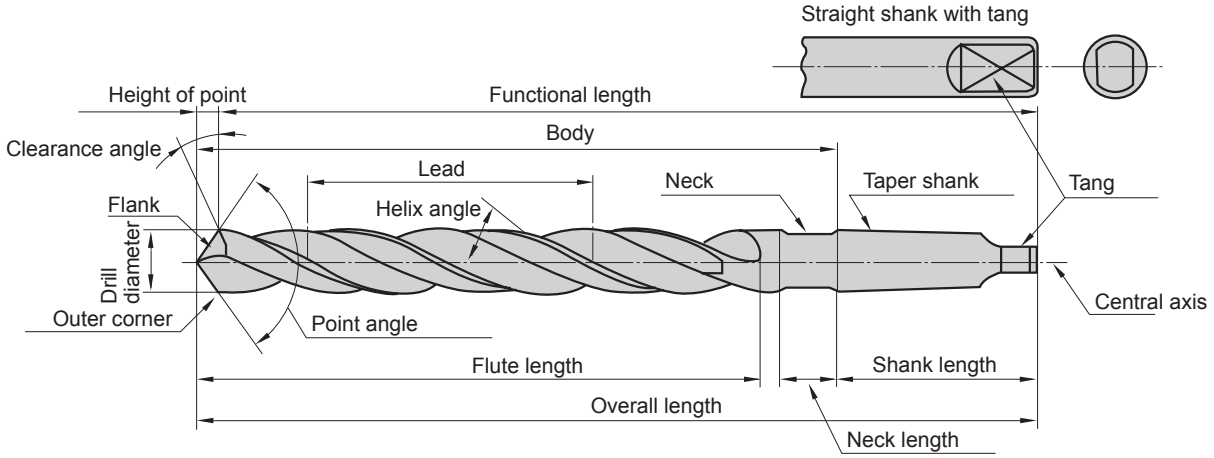
When drilling, the cutting edge of the drill can suffer from chipping, fracture and abnormal damage. In such cases, it is important to take a closer look at the damage, investigate the cause and take countermeasures.

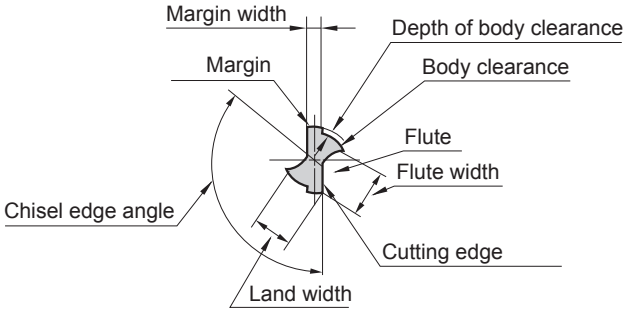


Cutting edge damage

DRILL TERMINOLOGY AND CUTTING CHARACTERISTICS

NAMES OF EACH PART OF A DRILL





SHAPE SPECIFICATION AND CUTTING CHARACTERISTICS

Helix Angle	Is the inclination of the flute with respect to the axial direction of a drill, which corresponds to the rake angle of a bit. The rake angle of a drill differs according to the position of the cutting edge, and it decreases greatly as the circumference approaches the centre.The chisel edge has a negative rake angle, crushing the work. **High-hardness material** **Small** ◀·· **Rake angle** ··▶ **Large** **Soft material** (Aluminium, etc.)
Flute Length	It is determined by depth of hole, bush length, and regrinding allowance. Since the influence on the tool life is great, it is necessary to minimize it as much as possible.
Point Angle	In general, the angle is 118° which is set differently to various applications. **Soft material with good machinability** **Small** ◀·· **Point angle** ··▶ **Large** **For hard material and high-efficiency machining**
Web Thickness	It is an important element that determines the rigidity and chip raking performance of a drill. The web thickness is set according to applications. Small cutting resistance Low rigidity Good chip raking performance Machinable material } **Thin** ◀·· **Web thickness** ··▶ **Thick** { Large cutting resistance High rigidity Poor chip raking performance High-hardness material, cross hole drilling, etc.
Margin	The tip determines the drill diameter and functions as a drill guide during drilling. The margin width is determined in consideration of friction during hole drilled. **Poor guiding performance** **Small** ◀·· **Margin width** ··▶ **Large** **Good guiding performance**
Diameter Back Taper	To reduce friction with the inside of the drilled hole, the portion from the tip to the shank is tapered slightly. The degree is usually represented by the quantity of reduction in the diameter with respect to the flute length, which is approx. 0.04—0.1mm. It is set at a larger value for high-efficiency drills and the work material that allows drilled holes.

CUTTING EDGE GEOMETRY AND ITS INFLUENCE

As shown in the table below, it is possible to select the most suitable cutting edge geometry for different applications. If the most suitable cutting edge geometry is selected then higher machining efficiency and higher hole accuracy can be obtained.

Cutting Edge Shapes

Grinding name	Shape	Features and effect	Application
Conical		• The flank is conical and the clearance angle increases toward the centre of the drill.	• General Use
Flat		• The flank is flat. • Easy grinding.	• Mainly for small diameter drills.
Three flank angles		• As there is no chisel edge, the results are high centripetal force and small hole oversize. • Requires a special grinding machine. • Surface grinding of three sides.	• For drilling operations that require high hole accuracy and positioning accuracy.
Spiral point		• To increase the clearance angle near the centre of the drill, conical grinding combined with irregular helix. • S type chisel edge with high centripetal force and machining accuracy.	• For drilling that requires high accuracy.
Radial lip		• The cutting edge is ground radial with the aim of dispersing load. • High machining accuracy and finished surface roughness. • For through holes, small burrs on the base. • Requires a special grinding machine.	• Cast Iron, Aluminium Alloy • For cast iron plates. • Steel
Centre Point drill		• This geometry has two-stage point angle for better concentricity and a reduction in shock when exiting the workpiece.	• For thin sheet drilling.

WEB THINNING

The rake angle of the cutting edge of a drill reduces toward the centre, and it changes into a negative angle at the chisel edge. During drilling, the centre of a drill crushes the work, generating 50–70% of the cutting resistance. Web thinning is very effective for reduction in the cutting resistance of a drill, early removal of cut chips at the chisel edge, and better initial bite.

Shape	 **X type**	 **XR type**	 **S type**	 **N type**
Features	The thrust load substantially reduces, and the bite performance improves. This is effective when the web is thick.	The initial performance is slightly inferior to that of the X type, but the cutting edge is hard and the applicable range of work is wide.	Popular design, easy cutting type.	Effective when the web is comparatively thick.
Major Applications	General drilling and deep hole drilling.	Long life. General drilling and stainless steel drilling.	General drilling for steel, cast iron, and non-ferrous metal.	Deep hole drilling.

DRILLING CHIPS

Types of Chips	Shape	Features and Ease of Raking
Conical Spiral		Fan-shaped chips cut by the cutting edge are curved by the flute. Chips of this type are produced when the feeding rate of ductile material is small. If the chip breaks after several turns, the chip raking performance is satisfactory.
Long Pitch		The generated chip comes out without coiling. It will easily coil around the drill.
Fan		This is a chip broken by the restraint caused by the drill flute and the wall of a drilled hole. It is generated when the feed rate is high.
Segment		A conical spiral chip that is broken before the chip grows into the long-pitch shape by the restraint caused by the wall of the drilled hole due to the insufficiency of ductility. Excellent chip disposal and chip discharge.
Zigzag		A chip that is buckled and folded because of the shape of flute and the characteristics of the material. It easily causes chip packing at the flute.
Needle		Chips broken by vibration or broken when brittle material is curled with a small radius. The raking performance is satisfactory, but these chips can pack closely creating.

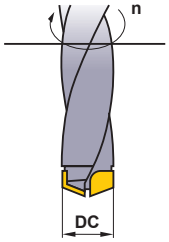
FORMULAE FOR DRILLING

CUTTING SPEED (vc)

$$vc = \frac{\pi \cdot DC \cdot n}{1000} \text{ (m/min)}$$

vc (m/min) : Cutting Speed
π (3.14) : Pi
DC (mm) : Drill Diameter
n (min^{-1}) : Main Axis Spindle Speed

*Divide by 1,000 to change to m from mm.



(Problem) What is the cutting speed when main axis spindle speed is 1350min^{-1} and drill diameter is 12mm ?

(Answer) Substitute π=3.14, DC=12, n=1350 into the formula

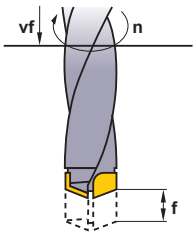
$$vc = \frac{\pi \cdot DC \cdot n}{1000} = \frac{3.14 \times 12 \times 1350}{1000} = 50.9\text{m/min}$$

The cutting speed is 50.9m/min.

FEED OF THE MAIN SPINDLE (vf)

$$vf = fr \cdot n \text{(mm/min)}$$

vf (mm/min) : Feed Speed of the Main Spindle (Z axis)
fr (mm/rev) : Feed per Revolution
n (min^{-1}) : Main Axis Spindle Speed



(Problem) What is the spindle feed (vf) when the feed per revolution is 0.2mm/rev and main axis spindle speed is 1350min^{-1} ?

(Answer) Substitute fr=0.2, n=1350 into the formula

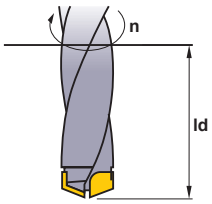
$$vf = fr \times n = 0.2 \times 1350 = 270\text{mm/min}$$

The spindle feed is 270mm/min.

DRILLING TIME (Tc)

$$Tc = \frac{ld \cdot i}{n \cdot fr}$$

Tc (min) : Drilling Time
n (min^{-1}) : Spindle Speed
ld (mm) : Hole Depth
fr (mm/rev) : Feed per Revolution
i : Number of Holes



(Problem) What is the drilling time required for drilling a 30mm length hole in alloy steel (JIS SCM440) at a cutting speed of 50m/min and a feed 0.15mm/rev ?

(Answer) Spindle Speed $n = \frac{50 \times 1000}{15 \times 3.14} = 1061.57\text{min}^{-1}$

$$Tc = \frac{30 \times 1}{1061.57 \times 0.15} = 0.188$$

$$= 0.188 \times 60 \fallingdotseq 11.3 \text{ sec}$$

SURFACE ROUGHNESS

SURFACE ROUGHNESS

(From JIS B 0601-1994)

Type	Code	Determination	Determination Example (Figure)
Arithmetical Mean Roughness	Ra	Ra means the value obtained by the following formula and expressed in micrometer (μm) when sampling only the reference length from the roughness curve in the direction of the mean line, taking X-axis in the direction of mean line and Y-axis in the direction of longitudinal magnification of this sampled part and the roughness curve is expressed by y=f(x): $Ra=\frac{1}{l}\int_0^l\{f(x)\}dx$	Maximum Height	Rz	Rz shall be that only when the reference length is sampled from the roughness curve in the direction of the mean line, the distance between the top profile peak line and the bottom profile valley line on this sampled portion is measured in the longitudinal magnification direction of roughness curve and the obtained value is expressed in micrometer (μm). (Note) When finding Rz, a portion without an exceptionally high peak or low valley, which may be regarded as a flaw, is selected as the sampling length. $Rz=R_P+Rv$	Ten-Point Mean Roughness	RzJIS	RzJIS shall be that only when the reference length is sampled from the roughness curve in the direction of its mean line, the sum of the average value of absolute values of the heights of five highest profile peaks (Yp) and the depths of five deepest profile valleys (Yv) measured in the vertical magnification direction from the mean line of this sampled portion and this sum is expressed in micrometer (μm). $Rz_{JIS}=\frac{(Yp1+Yp2+Yp3+Yp4+Yp5)+(Yv1+Yv2+Yv3+Yv4+Yv5)}{5}$	 $Yp1, Yp2, Yp3, Yp4, Yp5$: altitudes of the five highest profile peaks of the sampled portion corresponding to the reference length l. $Yv1, Yv2, Yv3, Yv4, Yv5$: altitudes of the five deepest profile valleys of the sampled portion corresponding to the reference length l.

RELATIONSHIP BETWEEN ARITHMETICAL MEAN (Ra) AND CONVENTIONAL DESIGNATION (REFERENCE DATA)

Arithmetical Mean Roughness Ra		Max. Height Rz	Ten-Point Mean Roughness RzJIS	Sampling Length for Rz • RzJIS l (mm)	Conventional Finish Mark
Standard Series	Cutoff Value λc (mm)	Standard Series			
0.012 a	0.08	0.05s	0.05z	0.08	▽▽▽▽
0.025 a	0.25	0.1 s	0.1 z		
0.05 a		0.2 s	0.2 z	0.25	
0.1 a	0.8	0.4 s	0.4 z		
0.2 a		0.8 s	0.8 z	0.8	
0.4 a		1.6 s	1.6 z		▽▽▽
0.8 a		3.2 s	3.2 z		
1.6 a		6.3 s	6.3 z		
3.2 a	2.5	12.5 s	12.5 z	2.5	▽▽
6.3 a		25 s	25 z		
12.5 a	8	50 s	50 z		▽
25 a		100 s	100 z	8	
50 a		200 s	200 z		–
100 a	–	400 s	400 z	–	

*The correlation among the three is shown for convenience and is not exact.
*Ra: The evaluation length of Rz and RzJIS is the cutoff value and sampling length multiplied by 5, respectively.

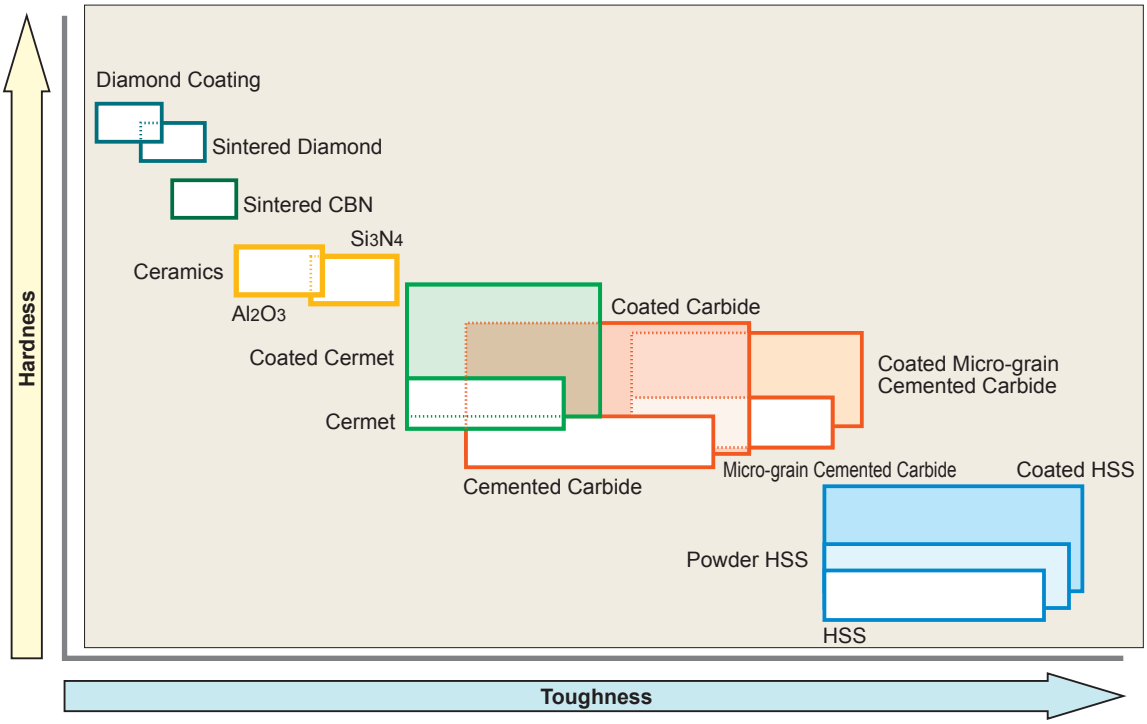
CUTTING TOOL MATERIALS

The table below shows the relationship between various tool materials, in relation with hardness on a vertical axis and toughness on a horizontal axis. Today, cemented carbide, coated carbide and TiC-TiN-based cermet are key tool materials in the market. This is because they have the best balance of hardness and toughness.



GRADE CHARACTERISTICS

Hard Materials	Hardness (HV)	Energy Formation (kcal/g·atom)	Solubility in Iron (%.1250℃)	Thermal Conductivity (W/m·k)	Thermal Expansion (x 10^{-6}/k)*	Tool Material
Diamond	>9000	–	Highly Soluble	2100	3.1	Sintered Diamond
CBN	>4500	–	–	1300	4.7	Sintered CBN
Si_3N_4	1600	–	–	100	3.4	Ceramics
Al_2O_3	2100	-100	≒0	29	7.8	Ceramics Cemented Carbide
TiC	3200	-35	< 0.5	21	7.4	Cermet Coated Carbide
TiN	2500	-50	–	29	9.4	Cermet Coated Carbide
TaC	1800	-40	0.5	21	6.3	Cemented Carbide
WC	2100	-10	7	121	5.2	Cemented Carbide
